Lincoln Land Wind, LLC Siting Approval Permit Application

Dear Mr. Douglas,

Enclosed for your review is our Application for the granting of a Siting Approval Permit from the Morgan County Board of Commissioners for the proposed Lincoln Land Wind project. As required in the Morgan County Wind Energy Conversion Systems Siting Regulations Ordinance (Ordinance No. 2019-10) we are providing 12 printed copies of the enclosed application, plus an additional copy. The application includes the following items:

- Lincoln Land Wind Siting Approval Permit Application
- Project Site Plan and Maps
- Landowner Contact Data
- Shadow Flicker Report
- Sound Modeling Report
- Economic Impact Study
- Community Grants Program Summary
- Decommissioning Plan
- Federal Aviation Administration (FAA) submission
- National Telecommunications and Information Administration (NTIA) letter
- Environmental Reports
- Agricultural Impact Mitigation Agreement (AIMA)
- Evaluation of Public Roads Report
- Communication Analysis
- Property Values Study
- Turbine Design and Certification
- Emergency Action Plan
- Drainage Plan
- Financial Assurance Forms
- Railroad Easement

Thank you for your attention to this matter. If you have any questions, please contact me at (641) 812-0070.

Sincerely,

Holly McCoy-Nelson
Senior Development Manager, Lincoln Land Wind, LLC

1 Siting Approval Application Summary

Lincoln Land Wind, LLC (Applicant or Lincoln Land Wind), is developing an up to 303.6 MW nameplate capacity wind energy conversion system (WECS) known as the Lincoln Land Wind Project (Project).

The Applicant respectfully requests approval of the following siting approval permit application (Application) by the Morgan County Board of Commissioners (Board). As detailed below, the Applicant has met all requirements set forth in Morgan County's Wind Energy Conversion Systems Siting Regulations Ordinance, Ordinance No. 2019-10 (Ordinance). Accordingly, the Applicant respectfully requests that the Board vote to approve the Application and issue a Siting Approval Permit to construct and operate the Lincoln Land Wind Project.

1.1 WECS Project Overview

The Project includes roughly 36,000 acres of agricultural land in eastern Morgan County, Illinois, with the center of the Project area located 8 miles east of South Jacksonville. The Project is roughly bounded by the Morgan-Sangamon County line to the east, the Village of Franklin to the south, slightly beyond Old State Road to the north, and the junctions of State Highway 104 and Interstate 72 to the west. The transportation corridors within the Project area include Interstate 72, Illinois State Highway 104, and several roads that fall under the jurisdiction of the County and local Road Districts.

The Project area is largely utilized for agricultural purposes with corn and soybeans as the predominant crops. All wind turbines will be located on land currently used for growing crops with each turbine and access road utilizing approximately 0.25 to 0.50 acres of land. The access roads to each turbine will comprise most of this acreage. In some cases, existing field lanes are being upgraded to an access road. Both landowners and tenant farmers can use the access roads for agricultural purposes. In addition, construction and operation of the Project will not significantly affect current land use in the Project area, and crop production can continue up to and surrounding the wind turbines and access roads.

This portion of Morgan County is considered an excellent location for constructing and operating a wind farm. The area contains large, open, and flat farmland, a strong wind resource, close proximity to existing transmission infrastructure, interested landowners and broad community support, readily accessible transportation routes for delivery and construction of turbine components, and suitable topography to support turbine foundations.

The Project would bring a capital investment of more than $400 million of clean, cost-effective energy to Morgan County, helping the State of Illinois meet its statutory goal of increasing renewable energy generation to 25% of total generation by 2025. Over the expected 30-year life of the Project, it would generate up to roughly $241.5 million in direct economic benefits for local landowners, new local employees, Morgan County, and the State of Illinois, in addition to fees associated with permitting the Project. Additional benefits include spending related to these payments that will feed into the local economy in and around the Project area, and collateral spending during Project construction.

Project staff and representatives have built considerable relationships with local organizations emphasizing the value the Project can bring to the area. This outreach includes contributions in

community grants supporting many organizations in the area including Franklin High School, Morgan County 4H, Jacksonville Park Foundation, and more.

The Applicant anticipates that Project construction will commence toward the end of 2020 or during the first part of 2021. The construction of the Project could be delayed or accelerated depending on several factors, including permitting, financing, turbine supply, and obtaining a Power Purchase Agreement (PPA).

1.2 Applicant Description and Contact Information

The Applicant is a Delaware limited liability company and wholly owned indirect subsidiary of Apex Clean Energy Holdings, LLC (Apex). Apex is an independent renewable energy company headquartered in Charlottesville, Virginia. Apex has a diversified portfolio of renewable energy resources capable of producing more than 17,000 MW of clean energy. Apex has brought nearly 3,000 MW online since 2012 and currently provides asset management services for 1,600 MW of clean energy projects. Apex has one of the nation's largest, most diversified portfolios of renewable energy resources and has the experience, skills, personnel, and proven capability to successfully manage wind and solar project development. Apex offers comprehensive in-house capabilities, including site origination, permitting, financing, construction, and long-term asset management services, and it works with corporations, utilities, and government entities, including McDonald's, Facebook, Walmart, Starbucks, IKEA, DTE Energy, Xcel Energy, and the U.S. Army.

Through this experience, Apex Clean Energy has won numerous awards, including the American Wind Energy Association's 2018 and 2019 Safety and Health Gold Achievement Award, the Sustainable Purchasing Leadership Council's 2017 Business Case Award for providing energy security to U.S. Army Garrison Fort Hood in Texas, and the Wind Farm Team of the Year in 2017 for operations and management of the Kay Wind Project in Oklahoma. A testament to the company's strong core values, the Hoopeston Wind farm, developed and managed by Apex in Vermilion County, Illinois, recently achieved 1,000 injury-free days. For an overview of Apex's mission, values, and top-notch team, please visit www.apexcleanenergy.com.

Company's address and telephone numbers are as follows:

Apex Clean Energy, Inc.
310 4th Street
Suite 300
Charlottesville, VA 22902

1.3 Project Participant Contact Information

Community support for the Project has been overwhelmingly positive, as 358 landowners have signed agreements to participate in the Project ("Participating Landowners") across roughly 36,000 participating acres.

The Project's compensation package will provide approximately $90 million in payments to Participating Landowners over the course of the Project's 30-year life. This includes 202 full leases executed, 18 underground collection easements (UCE), and 16 good neighbor agreements (GNA). The compensation formula in the full landowner leases includes a community pool in which landowners receive payments for signed acreage, turbines hosted on signed parcels, and other facilities installed on signed parcels such as underground collection cables and turbine access roads. This type of lease agreement pays all participants, even those that do not get the opportunity to host wind facilities on their property. Some landowners chose not to sign a full lease but were willing to host only underground collection cables that pay an amount based on the linear length of cable installed. And finally, some landowners chose not to host turbines or any associated facilities but nonetheless wanted to support the project through good neighbor agreements that offer an annual payment.

All the land included in the Lincoln Land Wind Project has been secured through agreements that were voluntarily signed. One Purchase Option Agreement, which allows the property to be purchased in the future, has been signed for the substation and operations and maintenance (O&M) building. The names, addresses, and telephone numbers of the Participating Landowners in the Project, as well as memoranda reflecting lease or easement agreements entered into with Participating Landowners, can be found in Book II of the Application. Participating Landowner contact data can be found in Appendix 2, and the Site Control map in Appendix 1.2 illustrates that all parcels hosting any type of facility for the Project have signed an agreement.

1.4 Project Facilities Overview and Site Plan

Overview

The Project will be situated on approximately 36,000 acres in Morgan County and will consist of up to 107 turbines. The total installed capacity of the Project will not exceed 303.6 MW and will deliver electricity to a single point of interconnection on the existing Ameren Meredosia-Austin 345 kilovolt (kV) transmission line running west-east through the Project area. The Project will consist of:

- Up to 107 wind turbines with a maximum height of up to 598.6 feet when the blade is in the up-most position;
- Access roads to each turbine;
- Underground 34.5 kilovolt (kV) electrical collector lines connecting the turbines to the collector substation and associated facilities;
- Underground fiber-optic cable for turbine communications co-located with the collector lines;
- A 34.5 kV to 345 kV "step-up" collector substation owned by Lincoln Land Wind;
- An O&M facility co-located with the substation;

- Two permanent meteorological towers and up to one temporary power performance tower; and
- Temporary construction facilities such as a laydown yard and a concrete batch plant.

Design

The Project has been designed to comply with all Morgan County setback requirements as shown in the setback list and setback maps in Appendix 1.3. These requirements are set forth in the Ordinance.

Shadow flicker will be less than 30 hours/year at nonparticipating occupied structures, unless a waiver has been signed, as detailed in the shadow flicker analysis provided in Appendix 3. Apex will mitigate for the two structures over the limit by either implementing a shadow flicker operating procedure, shifting the turbine(s) less than 250 feet to be compliant, not building the turbine(s), or obtaining waivers from the landowners. Finally, sound levels produced by the Project will comply with limitations imposed by the Illinois Pollution Control Board. The details of the sound study are provided in Appendix 4.

Turbines

Each wind turbine consists of three major components: the tower, the nacelle, and the rotor. These components are mounted on a concrete foundation to provide structural support to the assembled turbine. The height of the tower, or "hub height" (height from the base of the tower to the center of the rotor hub on top of the tower), will be dependent on the final turbine selection and design. The nacelle sits atop the tower, and the rotor hub is mounted on a drive shaft that is connected to the gearbox and generator contained within the nacelle.

Tower: The tubular towers for the Project will be conical steel structures or a combination of steel and concrete, depending on final turbine selection. Each tower has a lockable access door, internal lighting and an internal ladder to access the nacelle.

Nacelle: The main mechanical and electrical components of the wind turbine are housed in the nacelle. The nacelle is mounted on a sliding ring that allows it to rotate, or "yaw," into the wind to maximize energy capture. The nacelle components include the drive train, gearbox, generator, and generator step-up transformer. The nacelle is housed in a steel-reinforced fiberglass shell that protects internal machinery from the environment. The housing is designed to allow for adequate ventilation to cool internal machinery. It is externally equipped with an anemometer and a wind vane to measure wind speed and direction. The generated electricity is conducted through cables within the tower to a switch enclosure mounted at the base of the turbine tower.

Rotor: A rotor assembly is mounted on the drive shaft and operates upwind of the tower. Electric motors within the rotor hub vary the pitch of each blade according to wind conditions to maximize turbine efficiency at varying wind speeds.

Turbine operation controls: Having turbines and/or anemometers that are working properly is an important aspect of a well-operating wind project. Each turbine will have multiple redundant sensors on the rotor and drive train to sense when blades become imbalanced or create vibration and can automatically shut down the turbine and anemometer. The anemometers monitor the wind speed and direction to ensure its current position is most efficient to produce electricity. These data are also used for feathering the blades, applying the brakes in high wind speeds,

determining if the blades are off-balance, and to communicate to the turbine when the wind is strong enough to begin turning the generator and producing electricity at the “cut-in” wind speed.

The Applicant is considering turbine models in the 2.8 MW to 4.8 MW range with a maximum hub height of up to 114 meters (374 feet), a rotor diameter of up to 150 meters (492 feet), and a tip height of up to 182.5 meters (598.6 feet). A specific turbine model has not been selected at this time, but currently the leading candidate is the General Electric GE127 2.82-MW turbine at a 114-meter hub height and 127-meter (417-foot) rotor diameter with a tip height of 178 meters (582 feet).

If the GE127 is the selected turbine for the Project, the Project will utilize 107 turbine locations to achieve the necessary MW capacity of the Project. However, circumstances may arise that were not known when the Application was submitted that could cause an approved turbine location to become unusable. To account for such situations, the Applicant has submitted spare turbine locations to serve as backups in the event any primary locations become unusable. To that end, the Applicant is seeking permitting approval for up to 12 spare turbine locations throughout the Project area. Accordingly, the Project Summary map shows 119 turbine locations for the County’s consideration, though no more than 107 turbine locations will ultimately be used for the Project.

The Applicant is also considering three additional turbine models for the Project: the General Electric GE140 3.03-MW turbine, the Vestas V150 4.2-MW turbine, and the Nordex N149 4.8-MW turbine. All setback distances are calculated using the maximum potential rotor diameter of 150 meters (492 feet) and tip height of 182.5 meters (598.6 feet) to cover all four turbines included in this Application. Table 1.4 below shows the dimensions of the four turbine models under consideration. The turbine locations shown in the Project Summary map in Appendix 1.1 comply with all setbacks and restrictions when factoring the maximum dimensions across the possible turbine models shown in Table 1.4.

Table 1.4 Capacity and Dimensions of Considered Turbine Models

Model	Capacity	Hub Height	Rotor Diameter	Tip Height
GE127	2.82 MW	374 feet	417 feet	582 feet
GE140	3.03 MW	322 feet	460 feet	551 feet
V150	4.2 MW	345 feet	492 feet	591 feet
N149	4.8 MW	355 feet	489 feet	598.6 feet

To be conservative, the impact calculations discussed throughout this Application include all 119 proposed turbine locations. If the GE140, V150, or N149 turbines are selected, they will need fewer than the 107 locations needed for the GE127 turbine. The Applicant plans to select the most appropriate technology for the Project in terms of cost efficiency and optimization of wind and land resources. Whichever turbine model(s) and locations are selected, the final Project layout will comply with all applicable County and State height, setback, sound, and shadow flicker requirements, and final turbine locations will be based on the turbine locations submitted in this Application. If one or more of the alternative turbine models discussed above is selected, the Applicant will provide the Regional Planner with sound and shadow flicker studies, as well as new setback maps, to demonstrate compliance before submitting an application for a WECS Building Permit.

The Project Summary map in Appendix 1.1 shows the 107 proposed primary wind turbine locations, as well as the 12 proposed spare turbine locations. As a result of final micro-siting, minor shifts in the turbine locations may be necessary to avoid newly identified cultural resources or due to geotechnical testing results of the wind turbine locations, landowner input, newly

identified microwave beam paths, or other factors. Therefore, the Applicant requests that the Board approve this Application with a condition that expressly allows turbines to be shifted up to 250 feet from each turbine location identified in the Application without prior Board approval, so long as the turbine shifts comply with all county and state setback requirements and specified noise and shadow flicker requirements; cultural resource impacts are avoided or mitigated; environmental minimization and avoidance measures are adhered to; and wetland impacts are avoided or appropriately permitted. The Applicant will notify the Regional Planner of these shifts and will identify final turbine locations in the application for a WECS Building Permit.

Access Roads

New access roads will be constructed between existing roadways and Project infrastructure and sited with the goal of minimizing their impact. The new and improved access roads will be gravel surfaced and generally 16 feet in width. During construction, some of the access roads will be widened to accommodate movement of the turbine erection crane, with temporary widths generally not exceeding 50 feet. Following construction, the access roads will be reduced back to 16 feet and the area temporarily used will be restored, to the extent practicable.

Separate access may be required for the cranes used to erect the wind turbines. In such cases, temporary crane paths will be constructed between turbine locations. Following completion of construction, the temporary crane paths will be removed and the area reasonably restored to its prior condition.

Underground Electrical Collector Lines

The Project will utilize underground electrical collector lines to connect turbines to one another and to deliver electricity to the electric grid. The electrical collector lines will consist of an underground cable system between the collector substation and the individual turbine locations. The collector system will be designed for operation at 34.5 kV. The collector lines will be installed in a trench at least 48 inches below the ground in a location that was reviewed by the landowner to minimize potential impact from the existing land uses. A fiber-optic cable and an additional separate ground wire will also be installed with the collector system. The fiber-optic cable will be used for Project-specific telemetry, control, and communication purposes. Above-ground junction boxes will be installed, as required, for connections or splices.

Collector Substation

The collector substation will consist of up to two substation transformers, circuit breakers, switching devices, auxiliary equipment, a control enclosure containing equipment for proper control, protection, monitoring, and communications, and associated equipment and facilities. The final location is shown on the Project Summary map in Appendix 1.1. The principal function of the substation is to increase the voltage from the collector system (34.5 kV) to the voltage of the transmission line (345 kV), which will transport the electricity of the entire Project to the Midcontinent Independent System Operator (MISO) grid via the interconnection switching station. The collector substation will be located within a fenced area. The fence will be designed in accordance with industry standards to provide safety and security.

Interconnection Switching Station

Associated with the Project is an interconnection switching station to be constructed by Ameren, the owner of the Meredosia-Austin 345 kV transmission line running through the Project area.

This station will serve as the electrical interconnection between the Project and the MISO electrical grid.

Meteorological Towers

Two permanent meteorological towers and up to one power performance tower will be installed as part of the Project. These towers are used to obtain wind data for performance management once the Project is operational. The towers will be self-supporting structures with heights not to exceed the hub height of the wind turbines. The permanent towers will be marked and lighted as specified by the FAA. The locations of permanent towers are shown on the Project Summary map in Appendix 1.1.

Operation & Maintenance (O&M) Facility

An O&M facility will be constructed at a location well-suited for access to all Project facilities, including turbines, substation, and switching station. The O&M facility is planned to be co-located with the collector substation shown on the Project Summary map in Appendix 1.1. The O&M facility will consist of a single- or two-story 4,000-6,000 square-foot building, which will house operating personnel, offices, operations and communication equipment, parts, storage and maintenance activities, and will host a vehicle parking area. An outdoor storage area for larger equipment and materials will also be included within a fenced area for safety and security.

SCADA System

The Project's design includes safety and control mechanisms. These mechanisms are generally monitored using a Supervisory Control and Data Acquisition (SCADA) system. Each turbine will be connected to the SCADA system via fiber-optic cable, which will allow the turbines to be monitored in real time by the O&M staff. The SCADA system will also allow the Project to be monitored remotely, increasing Project performance and reliability. Not only will the local O&M office have full control of the wind turbines, but a 24/7 Remote Operations Control Center (ROCC) will also have control of the individual turbines. These two teams coordinate to ensure that the wind turbines operate safely and efficiently.

1.5 Project Construction

Upon approval of the Application and issuance of a Siting Approval Permit, and as other state and federal approvals are obtained, Lincoln Land Wind will complete engineering-scale design of the access roads, construction areas, turbine foundations, and the electrical components including the underground electrical collector lines. Construction of the on-site roads, tower foundations, feeder lines, and substation will take approximately 7 to 9 months. Turbine installation will take approximately 4 to 6 months. Subject to receipt of the necessary permits and any weather delays, the Project is slated to commence commercial operations during the fourth quarter of 2021. For trenching of underground electrical collector lines during construction, Lincoln Land Wind personnel and its contractors will strip topsoil prior to trenching and restore topsoil after trenching is completed. Lincoln Land Wind will work closely with affected landowners to ensure their fences are maintained and drain tile and crop damage is monitored, recorded, and accounted for not only during construction activities but throughout the operation of the Project.

Lincoln Land Wind personnel and its contractors will confer with the Illinois Department of Transportation (IDOT) and obtain all required permits. Lincoln Land Wind has been in communication with Morgan County's Engineer and relevant Road District Commissioners

regarding the use of public roads for construction, maintenance and operation of the Project. As required by the Ordinance, any proposed public roads that will be used for construction purposes will be identified and approved by the respective Road District Commissioner and the County Engineer prior to the granting of the Siting Approval Permit. In addition, the Applicant will work with Morgan County's Engineer and relevant Road District Commissioners to develop and enter into Road Use Agreements prior to the issuance of any WECS Building Permit applications related to the construction of the proposed WECS Project. Reasonable measures will be taken to control dust during construction. Safety will be a top priority during all aspects of construction activities, especially on public roads.

1.6 Community Engagement/Economic Benefits

The Project is expected to create both short-term and long-term benefits to the local economy. Local economic benefits from construction activities would be short-term but significant. Local businesses, such as restaurants, grocery stores, hotels, and gas stations, would see increased business during this phase from construction-related workers. Local industrial businesses, including aggregate and cement suppliers, welding and industrial suppliers, hardware stores, automotive and heavy equipment repair, electrical contractors, drain tile installers, and maintenance providers, would also likely benefit from construction of the Project.

The Project represents a capital investment of roughly $400 million in Morgan County. Over the expected 30-year life of the Project, it would generate up to roughly $241.5 million in direct economic benefits for local landowners, new local employees, Morgan County, and the State of Illinois, in addition to fees associated with permitting the Project. Dr. David Loomis with Strategic Economic Research completed an Economic Impact Study assessing the short-term and long-term increases in jobs, income, and tax revenues for Morgan County and the State of Illinois from the Project.[1] The Economic Impact Study is provided in Appendix 5 and a summary of the total direct economic benefits expected to be produced by the Project is included in Table 1.6.1 below. Indirect benefits are not quantified below but are included in Dr. Loomis' study. Those indicated benefits include spending related to these direct payments that will feed into the local economy in and around the Project area.

Table 1.6.1 Direct Economic Benefit from Lincoln Land Wind

Payment	Beneficiary	Approximate Total
Lease Payments	Project Landowners	Up to $90 million over 30 years
Construction	~394 short-term direct and indirect jobs in Morgan County	$19.3 million in new earnings in Morgan County[2] $82.7 million in new earnings in Illinois
Operations	~14 long-term onsite direct jobs, and ~25 long-term indirect jobs in Morgan County	$1.6 million in new annual earnings in Morgan County $3.2 million in new annual earnings in Illinois

[1] Dr. Loomis is also Professor of Economics at Illinois State University and co-founder of the Center for Renewable Energy.
[2] The Morgan County numbers are embedded in the State of Illinois numbers so should not be added separately to get a total benefit amount.

Payment	Beneficiary	Approximate Total
Taxes paid to taxing jurisdictions in Morgan County	Morgan County	Up to $65.6 million
Permit Fees	Morgan County	Up to $1,169,450

To educate local business leaders about the contracting opportunities that construction and operation of a wind farm make available, the Project initiated a vendor program. Key to the success of the program was partnering with the Jacksonville Area Chamber of Commerce to host a vendor fair. Over 120 representatives of local businesses attended the fair and spoke directly with members of the Apex construction team.

Dr. Loomis' report also breaks down the projected tax revenues to various taxing bodies in Morgan County from the Project according to the valuation formula developed by the Illinois Department of Revenue.[3] Table 1.6.2 below summarizes the results of Dr. Loomis' analysis, which are discussed in greater detail in his report in Appendix 5. This analysis was based on preliminary turbine locations so the numbers below may change once a final turbine is selected and final locations are determined, since the amount each taxing body receives will depend on the number of turbines within that taxing body's district (for example, the revenue received by a local school district will depend on the final number of turbines sited in that district).

Table 1.6.2 Projected Property Tax Revenues generated from 303.6 MW

Taxing Entity	Average Annual Revenues over 30 years	Lifetime (30 years) Revenues
Local School Districts	$1,459,885	$43,796,590
Morgan County	$326,115	$9,783,445
Local Road Districts	$184,466	$5,533,989
Lincoln Land Community College	$154,194	$4,625,814
Local Fire Districts	$59,389	$1,781,699
West Sangamon Library[4]	$4,320	$129,614

Project staff and representatives have also built considerable relationships with local leaders and organizations emphasizing the value the Project can bring to the area. This outreach includes contributions in community grants supporting many organizations in the Morgan County community. A summary of the Project's community grant program is included in Appendix 6.

1.7 Compliance with Federal, State, and Local Requirements

As detailed below, the Project will comply with all Federal, State, and Local requirements prior to commencement of construction activities. All studies, permitting milestones, and coordination activities required in the Ordinance have been initiated or completed.

[3] Illinois Department of Revenue. Wind Energy Device Valuation. http://www.revenue.state.il.us/LocalGovernment/PropertyTax/WindEnergyDeviceValuation.pdf

[4] While the Project footprint overlaps the West Sangamon Library district, the Project is solely located in Morgan County.

1.8 Decommissioning

Section V.B.5 of the Ordinance requires an applicant seeking a Siting Approval Permit to submit a proposed Decommissioning Plan to Morgan County as part of the Application. The Applicant retained Westwood Professional Services, Inc. (Westwood) to prepare a proposed Decommissioning Plan in accordance with Section X of the Ordinance. A copy of the proposed Decommissioning Plan is included in Appendix 7. Please see Section 6 of this Application for a more complete discussion of the Project's proposed Decommissioning Plan.

2 Federal Compliance and Notifications

The Project submitted applications to, entered into agreements with, or otherwise conferred with the following federal regulatory agencies:

2.1 Federal Aviation Administration

The FAA has the regulatory authority to evaluate and permit structures which may pose a hazard to aviation. When evaluating a wind farm, FAA issues two determinations under the following federal regulations:

- U.S. Department of Transportation FAA Code of Federal Regulations, Part 77, dated March 1993—Objects Affecting Navigable Airspace; and
- U.S. Department of Transportation FAA Advisory Circular 70/7460-1K, Obstruction Marking and Lighting.

The maximum tip height of the wind turbines proposed for the Project is 598.6 feet above ground elevation. This maximum potential height conforms to the Ordinance's limitation of 600 feet.

In June 2019, the Applicant submitted a partial array filing to the FAA seeking a Determination of No Hazard for 15 turbine locations in the Project area at a turbine height of 599 ft. That application initiated a lengthy review process with the FAA to get a head start on analyzing potential aviation impacts of the Project. On August 25, 2019, the FAA issued Notices of Presumed Hazard for the turbine locations in the partial array filing, a standard step in the review process for any structure over 500 feet. On February 18, 2020, the Applicant submitted a final array to the FAA comprising the turbine locations submitted in this Application, fulfilling the requirement in Section V.B.5 of the Ordinance. That application is included in Appendix 8 of this Application. The FAA is conducting further study on the proposed turbine array with a final determination expected in the coming months.

Section VI.D.4 of the Ordinance requires an applicant to install Aircraft Detection Lighting Systems (ADLS) or other similar technology to reduce light pollution and visual impacts caused by WECS Towers provided the lighting technology is available and approved by the FAA. Wind turbines are required to have appropriate lighting to effectively alert aircraft of turbine locations, as regulated by the FAA. ADLS uses a combination of radar and associated software to control when turbine lights turn on. Under normal conditions, the lights stay off. If an aircraft enters the airspace near a wind project, the lights turn on. When the aircraft leaves that space the lights turn off again and remain off until another aircraft enters the space. This can significantly reduce the amount of time turbine lights are on and minimize potential nighttime light concerns. The Applicant has informed the FAA that it plans to file an application for ADLS after the agency issues final determinations on the final turbine array submitted on February 18.

2.2 United States Army Corps of Engineers

The United States Army Corps of Engineers (USACE) is responsible for regulating the discharge of dredged or fill material into waters of the United States, including wetlands, under Section 404 of the Clean Water Act (CWA). This can often include waterways and ditches that would not appear, based on size or water flow, to qualify as a jurisdictional wetland or waterbody.

The Applicant deployed Tetra Tech to conduct delineations of wetlands and other waters of the United States (WOUS) for the Project to determine the extent of potentially jurisdictional wetlands and other WOUS. Results of delineations completed to date have been used to inform Project design to ensure regulatory compliance with Section 404 of the CWA. Based on current design, it is anticipated that the Project can be authorized under USACE Nationwide Permit 12 with no pre-construction notification required.

2.3 National Telecommunications and Information Administration

On November 18, 2019, the Applicant submitted a notification letter to the National Telecommunications and Information Administration (NTIA) describing the Project to determine potential impacts. The Applicant received a response letter from the NTIA on January 24, 2020, indicating that no relevant federal agencies had concerns with wind turbine construction in the Project area. A copy of the response letter is included in Appendix 9.

2.4 United States Fish and Wildlife Service

As shown in Table 2.4 below, the Applicant has been coordinating with the United States Fish and Wildlife Service (USFWS) regarding the environmental impact of this Project since early 2018. The table below provides details on meetings with USFWS and milestones reached to date.

Table 2.4 Agency coordination milestones for the proposed Lincoln Land Wind Project.

Date	Subject
February 27, 2018	Lincoln Land Wind requested data from the USFWS on listed bat roosts and hibernacula, eagle nests, and any federally listed species that are known to occur within the vicinity of an original area of interest.
February 27, 2018	USFWS provided detailed information on all federally listed species in the area, other bat species found locally, and known 2018 bald eagle nests.
April 26, 2018	Lincoln Land Wind met with USFWS to receive input on the Tier 1, Tier 2, and Stage 1 risk review and agree upon a Tier 3/Stage 2 study plan.
May 21, 2019	Lincoln Land Wind met with USFWS and IDNR to discuss results of year 1 surveys and agree upon next steps to ensure regulatory compliance.

As a result of agency input, numerous studies were completed by third-party consultants to assess risk to birds, bats and other wildlife. The studies are provided in Appendix 10 and include: raptor nest surveys in 2018 and 2019; avian use surveys, initiated in 2018 and continuing through 2020; breeding habitat assessments for upland sandpiper (*Bartramia longicauda*) and black-billed cuckoo (*Coccyzus erythropthalmus*) in 2019, and for northern long eared bat (*Myotis septentrionalis* [NLEB]) and Indiana bat (*Myotis sodalist* [INBA]) in 2018; presence/probable absence bat surveys in 2018; and habitat assessments and presence/probable absence surveys for lined snake (*Tropidoclonion lineatum*) in 2018. A more thorough description of each study is provided below.

Birds

No federally listed bird species were recorded during baseline studies. Four state-listed threatened or endangered species were documented during baseline studies: northern harrier (*Circus hudsonius*; state-endangered), upland sandpiper (state-endangered), short-eared owl (*Asio flammeus*; state-endangered) and black-billed cuckoo (state-endangered). These species were observed in relatively low numbers, except for the northern harrier, which is generally a ubiquitous species observed during spring, fall and winter in the region. Upland sandpiper and black-billed cuckoo were documented onsite during the breeding season. As a result, additional habitat assessments were completed in accordance with the Illinois Department of Natural Resources (IDNR) recommendations to ensure potential disturbance to these species during Project construction will be avoided. (*See* Section 3.1, below, for further discussion.) No bald eagle (*Haliaeetus leucocephalus*) nests were documented within two miles of the Project and no non-eagle raptor nests were observed within the Project, suggesting low nest density and low risk of impact to nesting raptors, including eagles, from the construction or operation of the Project. Impact to all birds from operations, including raptors and eagles, is also expected to be low year-round.

Bats

Based on mist-net and acoustic bat surveys, probable absence of the federally threatened Northern Long-eared Bat (NLEB) is considered likely throughout the Project. Probable absence of the federally endangered Indiana Bat (INBA) is considered likely throughout most of the Project; however, acoustic surveys suggest that INBA is likely to utilize the suitable habitat located in the southwest portion of the Project. In accordance with the Illinois/Iowa USFWS Ecological Services Field Office draft Technical Assistance Letter (TAL) Guidelines, turbines will be sited 1,000 feet from suitable summer habitat for INBA and NLEB or be fully feathered from May 16 to July 31 from sunset to sunrise at wind speeds below 6.9 meters/second (m/s). In addition, turbines will be fully feathered from August 1 to October 15, from sunset to sunrise, at wind speeds below 6.9 m/s, as a measure to reduce the likelihood of take (defined in the Endangered Species Act). These measures are intended to eliminate the potential for listed bat take, and to also minimize the potential take for all bat species, as demonstrated in recent operational curtailment studies.

Lined Snake

The Project is within the range of the state-threatened lined snake and suitable habitat occurs onsite; however, probable absence of the species was confirmed through IDNR-approved on-site surveys. Given the results of this survey, no minimization or avoidance measures are necessary to minimize risk to the lined snake.

Based on survey results and the minimization and avoidance measures outlined above, both USFWS and IDNR concurred that risk to federally and state listed species is low and that no additional surveys are necessary for the Project to move forward into construction/operation.

2.5 United States Department of Agriculture

The Applicant will submit the Project's Site Map to the local United States Department of Agriculture (USDA) office to determine if any land used in the Project is participating in the USDA's Conservation Reserve Program (CRP). The Applicant will comply with USDA rules regarding CRP land.

3 State of Illinois Compliance and Notifications

Compliance with State of Illinois rules and regulations involved permit applications, consultations and/or agreements with the following agencies:

3.1 Illinois Department of Natural Resources

IDNR does not issue permits for wind farms. However, there are three areas in which IDNR may conduct an evaluation as part of the wind farm siting process:

WETLAND/FLOODPLAIN EVALUATIONS

IDNR has been consulted to determine whether the Project meets the construction criteria under IDNR Statewide Permit No. 6 – Minor, Non-Obstructive Floodway Construction Activities. The Applicant anticipates satisfying these criteria and therefore the Project will be eligible to proceed under IDNR Statewide Permit No. 6 due to the demonstrated minimal wetland and limited floodplain impact.

ECOCAT

IDNR may also be consulted by a governmental body approving a permit for potential impacts to Threatened or Endangered Species. This consultation is referred to as the Ecological Compliance Assessment Tool (ECOCAT). As a result of the consultation process, IDNR may issue recommendations to the local governmental body, but the governmental body is not required to accept them.

Appendix 10 includes the ECOCAT filing (ECOCAT # 1808749). ECOCAT contains the Section, Township, and Range data of the Project and generates a project map. Species of concern within the identified project area (and/or which may be affected by migrating through or, by reason of the project, avoiding the identified area) are examined.

ECOCAT requires state agencies and units of local governments to consider the potential adverse effects of proposed actions on Illinois endangered and threatened species and sites listed on the Illinois Natural Areas Inventory.

The ECOCAT process:

- Does not result in permits of any kind, but rather makes recommendations. Permits must be obtained from the respective regulatory agency;
- Does not satisfy the requirements of the federal Endangered Species Protection Act of 1972 and implementing regulations;
- Cannot prohibit or prevent a proposed action;
- Does not preempt, override, reduce or interfere with the powers of local governments or State agencies;
- Does not address impacts to natural resources which do not enjoy protected status, except to the extent they entail cumulative indirect adverse effects to protected resources; and
- Cannot protect or conserve listed species, Natural Areas, or Nature Preserves without the active participation and cooperation of agency and local officials.

ENDANGERED SPECIES CONSULTATION

The Applicant filed the ECOCAT submittal on March 14, 2018 based on an original area of interest within Morgan County. The Applicant had an introductory meeting with IDNR on April 23, 2018 to introduce the Project and discuss potential environmental impacts of the Project.

IDNR issued its official ECOCAT consultation response to the Applicant and the Morgan County Regional Planning Commissioner Director on May 24, 2018. (*See* Appendix 10). The following table outlines IDNR's recommendations and Lincoln Land Wind's responses; survey results and studies are discussed above in Section 2.4.

Table 3.1 IDNR Recommendations and Lincoln Land Wind Response

IDNR Recommendation	Lincoln Land Wind Response
Recommendation #1: The Department recommends the County consider imposing a requirement to the applicant to perform mist-net and acoustic bat surveys in wooded areas within or adjacent to the project area.	Mist net and acoustic surveys were completed in accordance with IDNR recommendations and USFWS guidelines in 2018.
Recommendation #2: The Department recommends the County consider imposing a requirement for the applicant to curtail turbine operations below wind speeds of 5.0 m/s during the period from July 15 through October 15 to conserve endangered, threatened, and non-listed bats.	Risk to federally listed bats (and therefore state listed bats) during fall migration will be minimized by feathering turbines from August 1 to October 15 at night at speeds up to 6.9 m/s in accordance with USFWS Guidelines for Wind Facilities Seeking a "Technical Assistance Letter".
Recommendation #3: The Department recommends the County consider imposing a requirement to conduct three years of mortality monitoring from July 1 to October 15 to statistically quantify bird and bat mortality, by species, due to turbine operations.	Post-construction monitoring surveys will be designed in coordination with IDNR and USFWS, and will be completed for a reasonable period as required in the Ordinance.
Recommendation #4: The Department recommends the County consider imposing a requirement for the applicant to conduct biological surveys for the presence of the State-listed threatened Lined Snake.	Lined snake presence/probable absence surveys were completed in accordance with IDNR recommendations in 2018.

ILLINOIS HISTORIC PRESERVATION REVIEW

Under the Illinois State Agency Historic Resources Protection Act, the Illinois Historic Preservation Division at IDNR (SHPO) studies the potential effects on archaeological and/or architectural (cultural) resources for projects that are funded by state or federal agencies. The Applicant anticipates that a General Storm Water Permit will be needed from the Illinois Environmental Protection Agency for construction. Accordingly, the Applicant has initiated archeological and architectural surveys to ensure a well-sited and low-impact Project. These surveys involved compilation and assessment of the following information:

- Complete description of Project;
- Project map;
- Project site plans and specifications;

- Project location;
- Existing site conditions (agricultural fields);
- Total acreage involved in project;
- Documentation of any prior non-agricultural disturbance at project site (photos, soils report, etc.);
- Current photos of structures impacted by the project and of any standing structures within the project area;
- Possible date of original construction of structure; and
- Any known historical information, i.e., whether structure significant in the community or is it associated with an individual of significance.

ARCHAEOLOGICAL STUDY

The Applicant completed an initial desktop review of the initial area of interest to inform Project siting and design. The Applicant initiated a Phase I cultural resource pedestrian survey in April 2019, which involved a field investigation of approximately 175 acres within portions of the Project area that fall within "Archaeological Resource Potential areas" as defined by the SHPO. Results of initial surveys concluded that the Project was unlikely to have an adverse effect on archaeological sites or historic properties. Additional surveys will be completed in spring 2020 within unevaluated areas where facilities are planned based on final design.

ARCHITECTURAL STUDY

The Applicant completed an initial desktop review of the initial area of interest to inform Project siting and design. The Applicant initiated an Architectural Reconnaissance Survey in May 2019, which included assessment of all structures within 1.5 miles of the Project boundary that are visible from public roads/right-of-way for cultural significance. Results of initial surveys suggest the Project is unlikely to have adverse impacts to historic properties, and the Applicant anticipates receiving final results in early 2020.

The Applicant has engaged with the SHPO regarding the archaeological and architectural studies currently underway in the Project area. Once these studies are completed in spring 2020, the Applicant will share the results with the SHPO and seek a concurrence letter demonstrating that the Agency concurs with the impact findings and mitigation practices (if applicable) proposed by the Applicant.

3.2 Illinois Environmental Protection Agency

The Illinois Environmental Protection Agency (IEPA) Division of Water Pollution Control is responsible for regulating wastewater discharges to Illinois streams and lakes, which includes issuance of stormwater permits under the National Pollutant Discharge Elimination System (NPDES) program.

Lincoln Land Wind will obtain a NPDES Permit for construction activities prior to the initiation of Project construction. To satisfy all standards for obtaining a NPDES permit, the Project will design a Stormwater Pollution Prevention Plan (SWPPP) to meet the requirements of the IEPA for stormwater discharge during construction activities. A detailed construction SWPPP will be developed for the Project to minimize potential for discharge of pollutants from the site during construction activities. The SWPPP will include both structural and non-structural best

management practices (BMPs). Examples of structural BMPs may include the installation of silt fences and/or other physical controls to divert flows from exposed soils, or otherwise limit runoff and pollutants from exposed areas of the site. Examples of non-structural BMPs include implementation of materials handling, disposal requirements and spill prevention methods. In addition, Lincoln Land Wind will utilize BMPs to avoid impacts to recent efforts made in the Lake Mauvaisterre Watershed Implementation Plan and Pollution Reduction Initiative improving water quality in Lake Mauvaisterre and Lake Jacksonville.

Before the commencement of construction on the Project, the Applicant will file a notice of intent and accompanying SWPPP for a general permit to discharge relating to storm water discharges during Project construction.

3.3 Illinois Pollution Control Board

The Illinois Pollution Control Board (IPCB) has promulgated regulations under 35 Ill. Admin. Code Sections 900, 901 and 910 that are applicable to wind farms. Under 35 Ill. Admin. Code §901, a WECS Project operating in an agricultural field (Class C Land) cannot cause an exceedance of sound levels to residential land (Class A Land) as highlighted in the excerpt below:

35 Ill. Admin. Code Section 901.102 Sound Emitted to Class A Land

DAYTIME SOUND LEVELS

a) Except as elsewhere provided in this Part, no person shall cause or allow the emission of sound during daytime hours from any property-line-noise-source located on any Class A, B or C land to any receiving Class A land which exceeds any allowable octave band sound pressure level specified in the following table, when measured at any point within such receiving Class A land, provided, however, that no measurement of sound pressure levels shall be made less than 25 feet from such property-line-noise-source.

Octave Band Center Frequency (Hertz)	Allowable Octave Band Sound Pressure Levels (dB) of Sound Emitted to any Receiving Class A Land from		
	Class C Land	Class B Land	Class A Land
31.5	**75**	72	72
63	**74**	71	71
125	**69**	65	65
250	**64**	57	57
500	**58**	51	51
1000	**52**	45	45
2000	**47**	39	39
4000	**43**	34	34
8000	**40**	32	32

NIGHT TIME SOUND LEVELS

b) Except as provided elsewhere in this Part, no person shall cause or allow the emission of sound during nighttime hours from any property-line-noise-source located on any Class A, B or C land to any receiving Class A land which exceeds any allowable octave band sound pressure level specified in the following table, when measured at any point within such receiving Class A land, provided, however, that no measurement of sound pressure levels shall be made less than 25 feet from such property-line-noise-source.

Octave Band Center Frequency (Hertz)	Allowable Octave Band Sound Pressure Levels (dB) of Sound Emitted to any Receiving Class A Land from		
	Class C Land	Class B Land	Class A Land
31.5	**69**	63	63
63	**67**	61	61
125	**62**	55	55
250	**54**	47	47
500	**47**	40	40
1000	**41**	35	35
2000	**36**	30	30
4000	**32**	25	25
8000	**32**	25	25

(Source: Amended at 30 Ill. Reg. 5533, effective March 10, 2006)

SOUND COMPLIANCE STUDY

The Applicant hired RSG to perform a sound modeling analysis for the proposed Project area. The GE127 turbine at 114m hub height was considered for the analysis. The analysis was performed in accordance with the standard ISO 9613-2, taking into account typical industry standards for modeling inputs and assumptions. The analysis is over-inclusive and therefore incorporated conservative assumptions since it evaluated all 119 proposed turbine locations, although a maximum of 107 turbine locations will be utilized for the Project. Another conservative parameter adopted by the study is that it included a 2 decibel (dB) uncertainty factor on top of the manufacturer's total sound output values.

The study, attached as Appendix 4, demonstrates that the Project will comply with the Illinois Pollution Control Board's noise regulations. To achieve full compliance, the Project will operate 47 out of 119 turbine locations in a Noise Reduced Operating (NRO) mode to accommodate the IPCB nighttime noise limits. There are three NRO modes utilized for the Project assuming that the Project selects the GE127 turbine. If the GE140, V150, or N149 turbines are selected, the Applicant will provide the County with a sound compliance study demonstrating compliance with IPCB standards for the selected machine prior to applying for a building permit.

POST-CONSTRUCTION NOISE ASSESSMENT

In accordance with Section VI.M of the Ordinance, after the Project has been operating for one year, the Applicant will hire a qualified third-party professional to conduct a sound study to evaluate compliance with the state's sound standards. The analysis and results of the post-

construction noise assessment will be presented in a report that will be submitted to Morgan County.

3.4 Illinois Department of Agriculture

The Illinois Renewable Energy Facilities Agricultural Impact Mitigation Act (505 ILCS 147/1, *et seq.*) requires the owner of a wind farm to enter into an Agricultural Impact Mitigation Agreement (AIMA) prior to a public hearing on a siting permit application. The intent of the AIMA is to preserve and/or restore the integrity of affected agricultural land during construction and decommissioning activities. Section V.B.7 of the Ordinance requires the Applicant to provide an AIMA between the Applicant and the Illinois Department of Agriculture. A copy of that AIMA, signed by the Applicant, is included in Appendix 11 and was sent to the Illinois Department of Agriculture on February 11, 2020. The Applicant will provide the County with an AIMA entered into with Illinois Department of Agriculture prior to a public hearing on this Application, as required in Section VI.N of the Ordinance.

4 Morgan County and Other Local Permits, Approvals, Agreements, and Notifications

In the State of Illinois, the lead permitting body for a wind farm is the county board of the county in which the project is located. The Illinois Counties Code expressly authorizes a county to "establish standards for wind farms and electric generating wind devices." (See 55 ILCS 5/5-12020.) Pursuant to this authority, although Morgan County has not adopted a zoning code, the County enacted siting standards for wind farms when it approved the Ordinance. The Ordinance specifies a variety of compliance requirements for approval of a site permit application. These requirements are discussed further below.

4.1 Design Safety Certification

All wind turbines are built to conform to industry standards including the American National Standards Institute ("ANSI"). The Applicant will provide a copy of wind turbine design compliance for the turbine model that is selected before the Applicant applies for WECS Building Permits.

Should the Board issue a Siting Approval Permit for the Project, pursuant to Section VI.A.2 of the Ordinance, the Applicant will present a certification from a qualified structural engineer, as part of the WECS Building Permit application, stating that the foundation and tower designs for the Project are compatible with and within acceptable standards given local soil and climate conditions. (Note that the engineering certification will also be sufficient to satisfy Section VI.R of the Ordinance; however, in contrast to Section VI.A.2 of the Ordinance, which appears earlier in the Ordinance, Section VI.R seems to require that an engineering certification be included with an application for a Siting Approval Permit. The Applicant submits a letter from Barr Engineering Co. pursuant to Section VI.R of the Ordinance, which is included in Appendix 15. As the letter indicates, an engineering assessment is not possible at this time on the grounds that the data necessary for such an analysis are proprietary to the turbine manufacturer and unavailable at this time since a turbine has yet to be selected. The Applicant requests that the County exercise its discretion in harmonizing the competing provisions to interpret the Ordinance in a manner that allows the Applicant to submit the engineering certification at the time the Applicant applies for a WECS Building Permit, which represents a more typical and reasonable approach.)

4.2 Controls and Brakes

All wind turbine models under consideration for the Project will be equipped with control systems and brakes. All turbine models will also be capable of control with a Process Logic Controller (PLC) system that detects over-speed situations (electronic detection). The PLC system includes a redundant braking system, aerodynamic over-speed controls such as variable pitch where the turbine blade pitches out of the wind and functions as a supplemental brake in addition to the mechanical brakes used by each turbine.

4.3 Electrical Components

All electrical components for the Project will conform to applicable national, state and local codes and relevant national and international standards such as ANSI. All electrical wires and cables connecting each wind turbine to other turbines will be installed underground to a depth of at least 48 inches in accordance with participating landowner agreements until they reach a substation.

4.4 Aesthetics and Lighting

The tower and blades for each wind turbine will be painted with a non-reflective unobtrusive color. The surface of each turbine will consist of non-reflective material. All wind turbine surfaces will be designed to resist erosion. No advertising or signage, outside of safety warnings or standard manufacturer markings, will be affixed to any of the turbines, and each turbine will comply with any other Morgan County ordinances relating to signage.

As discussed in Section 2.1, above, the Applicant will submit a request to deploy ADLS technology on the Project to the FAA for approval after receiving final determinations from the FAA on the proposed turbine locations.

4.5 Compliance with the Federal Aviation Administration

A detailed summary of Project compliance with all applicable FAA requirements has been included in Section 2.1 of this Application.

4.6 Warnings

Signage, including a visible warning concerning voltage and an 24/7 emergency contact number, will be placed at the base of all pad-mounted transformers at the Project substation, as well as at the entrance of access roads that connect to each Project wind turbine.

The wind turbine support towers, by design, will be self-supporting and not require guy wires. If guy wires are used for the MET towers, they will have reflective warning markers.

4.7 Climb Prevention

Access to the inside of wind turbines and to the Project substation will be limited to Project employees. Each wind turbine will be mounted on a tubular tower which will be a smooth, tapered monopole structure. The only climbing access will be by ladder or lift located inside the tower. The door to the tower will be kept locked. By design, the towers will be externally un-climbable.

4.8 Setbacks

In designing the layout for the Project, the Applicant worked with Participating Landowners to minimize impacts to farmland, residential properties, and any other site-specific concerns such as stream crossings. Where possible, the Project also tried to exceed minimum setbacks to primary residences.

In taking a conservative approach to setbacks from Project infrastructure, the proposed layout for the Project meets or exceeds the setbacks prescribed under Section VI.H of the Ordinance as follows and as shown in the County Setbacks map in Appendix 1.3:

- **Setback from Primary Structures:** All wind turbines and proposed turbine models have been sited at least 1320 feet from participating Primary Structures (as defined in the Ordinance) and 1650 feet from non-participating Primary Structures.

- **Setback from all Public Roads, Third Party Distribution and Transmission Lines, and Communications Towers:** All wind turbines and proposed turbine models have been sited 1.1 times the WECS Tower Height from these structures.

- **Setback from adjacent Parcel Lines:** All wind turbines and proposed turbine models have been sited 1.1 times the WECS Tower Height from neighboring parcel lines, or a setback waiver has been obtained from the owner of the neighboring parcel, as allowed by the Ordinance.

- **Setback from Public Conservation Lands:** All wind turbines and proposed turbine models have been sited at least 750 feet from the property line of any Public Conservation Lands (as defined in the Ordinance).

4.9 Use of Public Roads

The Applicant has engaged in discussions with Morgan County's Engineer and applicable Road District Commissioners in the Project on both the public road design plans and draft Road Use Agreements. The Applicant expects to execute Road Use Agreements with Morgan County and the Road Districts soon and will ensure that agreements are in place before issuance of a WECS Building Permit as required in Section VI.J.2.b the Ordinance. In addition, the Applicant will get approval of the roads planned to be used from the respective Road District Commissioners and the County Engineer prior to the granting of the Siting Approval Permit. The Applicant has conducted a pre-construction baseline survey for all roads the Project intends to use as required in Section VI.J.2.a of the Ordinance, a copy of which is included in Appendix 12.

4.10 Communications Analysis

To comply with Section VI.L.3 of the Ordinance, the Applicant must take commercially reasonable steps to minimize or mitigate any severe interference with microwave transmissions, residential television interference, or radio reception. The Project commits to undertaking commercially reasonable steps to respond to a written complaint related to interference caused by the Project as is required by the Ordinance. The Project will also take immediate actions to mitigate or minimize interference with communications that impact local government public safety as required in the Ordinance. The Applicant will also provide copies of the Project Summary and Site Plan to all applicable microwave transmission providers.

The Applicant contracted with Evans Engineering to conduct a communications analysis as required in Sections VI.L.1 and VI.L.2 of the Ordinance. The study found that no FCC-licensed land mobile or public safety transmitting stations are expected to be adversely affected. The study also assessed television channels within and beyond 1½ miles of the footprint of the Project to serve as a baseline reading for television reception conditions prior to the construction of the Project. The study indicates steps that may be taken should interference occur due to operations of the Project. A copy of the communications study is attached to the Application as Appendix 13.

4.11 Noise Levels

Please see Section 3.3 of the Application for a discussion demonstrating how the Project will comply with the Illinois Pollution Control Board's noise rules and regulations. The discussion references a sound study conducted by a qualified third-party professional that is attached as Appendix 4 to the Application.

4.12 Avian and Wildlife Impact Study

The Ordinance requires that a third-party, qualified professional conduct an avian and wildlife impact study. The Applicant hired WEST, Inc. to conduct bat, bird, and lined snake studies in the Project area. Those studies are provided in Appendix 10 and a summary of the results of the studies is included in Section 2.5 above.

4.13 Agricultural Impact Mitigation Agreement

The Ordinance requires that the Applicant provide an Agricultural Impact Mitigation Agreement (AIMA) between the Applicant and the Illinois Department of Agriculture with siting permit application. Attached as Appendix 11 is an AIMA that the Applicant has entered into with the Illinois Department of Agriculture. Please see Section 3.4 above for more details about the Project's AIMA.

4.14 Property Value Impact Study

Section XII.C.3 of the Ordinance allows the Board to approve a siting approval permit application if it finds that a project will not substantially diminish and impair property values of surrounding properties. MaRous and Company conducted a detailed analysis of the Project area, reviewed literature of county assessors in Illinois and other states across the Midwest, and examined home and property sales in wind projects around the region. The result of the review by Marous and Company is a study that determined that the Project would not have a negative impact on rural residential or agricultural property values in the surrounding area. MaRous and Company have extensive experience conducting market analyses of a variety of energy projects in the Midwest, as well as residential, commercial, and industrial developments, religious facilities, and recreational use sites. A copy of the study is provided in Appendix 14.

4.15 Height

Section VI.P of the Ordinance imposes a limit of 600 feet for the total height of a wind turbine. The maximum total height for the Project's turbines will not exceed 600 feet and will be compliant with all applicable FAA regulations.

4.16 Icing Conditions

In accordance with Section V.T.7 of the Ordinance, the Applicant will deploy two methods to detect icing conditions on turbine blades. First, turbine sensors and the turbine control system will assess ice accumulation. Second, the Project will monitor meteorological data to ascertain whether ice accumulation is likely to occur. The Project will be designed to shut down turbines if these conditions occur or the Applicant will manually shut down turbines if icing conditions are present.

4.17 Railroad Easements and Crossings

As depicted in the Project Summary map in Appendix 1.1, several rail lines transect portions of the Project's footprint. As a result, there are several locations in the Project area that will require a crossing agreement with railroad companies that operate rail lines in the Project. Two sections of underground collection cables connecting turbines C18, C19, C20, C21, C22, C24, C25, C26, C27, C28, and C30 (as depicted in the Project Summary map) necessitate running underground collection cables parallel to the railroad and within the railroad's right-of-way. A fully executed crossing agreement will be provided with the application for a WECS Building Permit. To demonstrate that the Project intends to pursue a crossing agreement to use the railroad's right-of-way, a copy of the railroad's standard crossing agreement is included in Appendix 19.

In the event that a crossing agreement cannot be executed for the above-referenced underground collection cables, the Applicant will remove from consideration the 11 turbine locations indicated above.

4.18 Coordination with Emergency Responders

Section VII.B.3 of the Ordinance requires that the Applicant cooperate with local emergency responders to develop an emergency response plan. The Applicant provides a draft Emergency Action Plan in Appendix 16. This draft plan is intended to demonstrate the attention, diligence, and resources the Applicant dedicates to safety and responding to emergency situations of all kinds. The Applicant will work with local responders to finalize the plan in the coming months.

In addition, on October 2, 2019, the Applicant's Director of Safety, John Boyle, coordinated with Phil McCarty, director of the Morgan County and Jacksonville Emergency Management Department, to host an initial emergency response training session for Morgan County first responders. The primary purpose of the training sessions was to introduce the Project, provide information about safety issues related to the wind farm construction and operation, and to set up communication channels for future coordination. As a former emergency responder, Mr. Boyle was able to establish important relationships for future collaboration to ensure safe operations at and around the Project.

Roughly 50 officers and fire fighters attended the trainings, representing the following fire departments:

1. Jacksonville Fire Department
2. Franklin Volunteer Fire Department
3. Woodson Volunteer Fire Department
4. Ashland Volunteer Fire Department
5. Waverly Volunteer Fire Department
6. Alexander Volunteer Fire Department

7. South Jacksonville Volunteer Fire Department

4.19 Shadow Flicker

The Applicant hired ArcVera Renewables to perform a shadow flicker modeling analysis for the proposed Project area. Openwind, a standard industry software, was used to perform the shadow flicker modeling. The GE127 turbine at 114m hub height was considered for the analysis. The analysis reflects a conservative approach in that all 119 turbine locations were evaluated, even though no more than 107 turbines will ultimately be utilized. If the GE140, V150, or N149 turbines are selected, the Applicant will provide the County with shadow flicker studies demonstrating compliance with the Ordinance.

The study from ArcVera Renewables, which is provided in Appendix 3, shows that one participating structure will exceed the 30 hours per year shadow flicker limit, and that one non-participating business structure will exceed the 30-hour limit. Apex will mitigate for the two structures over the limit by either implementing a shadow flicker operating procedure, shifting the turbine(s) less than 250 feet to be compliant, not building the turbine(s), or obtaining waivers from the landowners.

4.20 Drainage Plan

Section VII.F of the Ordinance requires the Applicant to repair drain tile systems that are damaged by Project construction. In addition, the lease agreements with Participating Landowners and the AIMA include requirements pertaining to repair of drainage tiles. The Applicant will comply with all state and local requirements related to the treatment and repair of drainage tiles. To that end, the Applicant includes a draft Drainage Tile Repair Plan for Morgan County's consideration and approval in Appendix 17.

4.21 Draft Forms of Financial Assurance

Appendix 18 includes copies of the draft forms of financial assurance for the Decommissioning Plan and road repairs as required in Sections X.A.7 and VI.J.2.b of the Ordinance, respectively.

5 Project Operations

The Project will be staffed locally from an O&M building co-located with Ameren's switchyard and the Project's substation. The Project will be operated and maintained by a team of roughly 14 personnel depending on the chosen turbine model, including facility managers, a site manager, and a certified crew of technicians. All contact information for the Project's facilities including the names of key Project staff will be provided to relevant Morgan County and Project Road District officials and authorities, and participating landowners.

5.1 Project Maintenance

During operations, the O&M staff will perform scheduled, preventive maintenance on the turbines. This is typically done in conjunction with representatives from the turbine manufacturer. Turbine maintenance is performed twice a year as a semiannual and annual maintenance. Semiannual maintenance is conducted on the turbine for 10 hours with a crew of technicians. It consists of lubrication, fluid checks, minor electrical inspections and checks of turbine functionality. The annual maintenance is a 36-hour inspection with a crew of technicians. During this inspection, the

entire turbine is maintained, including but not limited to bolt torque checks on tower and all major components, lubrication and filter changes, electrical inspections, pitch calibrations, and blade inspections. The onsite operations team also will drive throughout the Project on a daily basis conducting unrecorded visual inspections of the Project. This team will be at the Project site or O&M building during normal business hours and will also have specified personnel on-call 24 hours per day, seven days per week, should an issue arise outside of normal business hours.

Pursuant to Section VII.A. of the Ordinance, the Applicant will submit an operation and maintenance report on an annual basis to Morgan County.

5.2 Coordination with Emergency Responders

As required in Section VII.B of the Ordinance, the Applicant will provide, at its expense, annual training and necessary equipment to local emergency responders so they can properly respond to a potential emergency at the Project. The Applicant will also cooperate with local emergency responders to develop an emergency response plan that includes a 24-hour contact information for the Project and at least three of its representatives. Pre-operations coordination with emergency responders is discussed in Section 4.18 above.

5.3 Materials Handling, Storage, and Disposal

All solid wastes generated during the construction, operation, and maintenance of the Project will be removed from the site promptly and disposed of in accordance with all federal, state and local laws and regulations regarding waste disposal in accordance with Section VII.C. of the Ordinance.

It is not anticipated that the construction, operation and maintenance of the Project will result in the generation of any hazardous wastes. If hazardous waste is produced it will be handled according to local, state or federal laws and regulations.

Safety Data Sheets will be retained at the O&M building and copies of these sheets will be provided to the local fire departments in accordance with federal laws and regulations.

The Project will comply with all existing applicable septic and well regulations of Morgan County and the State of Illinois.

5.4 Liability Insurance

Section IX of the Ordinance requires a wind energy project to maintain a current insurance policy to cover installation and operation of the project beginning with issuance of a WECS Building Permit. The Applicant will maintain and pay for (a) comprehensive commercial general liability insurance with limits of not less than $5,000,000 per occurrence, and (b) excess liability insurance with a limit of not less than $20,000,000 in the aggregate, in each case for injury to any person and for damage to property. The Applicant will procure an applicable insurance policy through a reputable insurance provider with a net worth of at least $50,000,000. The Applicant will also ensure that an annual certificate of insurance will be provided to Morgan County.

5.5 Complaint Resolution

The Applicant will coordinate with the County to develop a system for logging and investigating complaints relating to the operation of the Project. The Applicant commits to resolving any

complaint on a case-by-case basis and will provide written confirmation to the Regional Planner after complaints are resolved. The Applicant will maintain a toll-free telephone number and an email address as a public information/complaint "hotline". The telephone number and email account will be staffed by a Project employee on a 24-hour basis, seven days per week.

6 Decommissioning Plan

Section X of the Ordinance requires an applicant seeking a Siting Approval Permit to work with Morgan County to formulate a Decommissioning and Site Reclamation Plan (Decommissioning Plan) to ensure that the Project is properly decommissioned at the end of its useful life. The Decommissioning Plan must be prepared by an independent certified Illinois Professional Engineer and must include the following:

1. Provisions describing the events for triggering decommissioning for the project;
2. A description of the methods and costs for decommissioning and removing the project's infrastructure, both above-ground and below-ground;
3. A description of the methods and costs for restoring soil and vegetation for areas disturbed by the construction and operation of the project;
4. A schedule and permit list necessary to perform the decommissioning tasks;
5. A description of the methods for identifying hazardous materials;
6. Submission of a draft form of Financial Security sufficient to cover the estimated costs for decommissioning activities;
7. A provision indicating that the Decommissioning Plan shall be binding on the Applicant and its successor-in-interest or assigns;
8. A confirmation by affidavit that the obligation to decommission the Project has been incorporated into agreements with Participating Landowners;
9. A provision that provides the authority to the County to transfer Project infrastructure to salvage firms;
10. Identification and procedures for the County to access Financial Assurances; and
11. A provision granting the County access to the Project site for decommissioning purposes.

The Applicant commissioned Westwood to prepare a proposed Decommissioning Plan for Lincoln Land Wind which both fulfills the decommissioning requirements of the Ordinance and aligns with the decommissioning commitments contained within the Project's AIMA. A copy of the Decommissioning Plan is included in Appendix 7.

Westwood determined the estimated decommissioning costs for the four turbine models submitted with this Application. The Decommissioning Plan provides the estimated cost of decommissioning each of the models based on the requirements in the Ordinance as well as cost assumptions based on a variety of factors including the future land use after decommissioning, engineering and construction practices, road and turbine removal, salvage value of Project materials, and more. A summary of the results of Westwood's analysis is provided in Table 6 below.

Table 6. Summary of Decommissioning Costs

Turbine Model	Cost Per Turbine (less salvage value)	Estimated Total Cost
GE127 (107 turbines)	$112,352	$12 million
GE140 (99 turbines)	$103,422	$10.2 million
V150 (72 turbines)	$111,720	$8 million
N149 (63 turbines)	$107,582	$6.78 million

As required by the Ordinance, the Applicant will provide a signed Decommissioning Plan to the Regional Planner prior to the issuance of a Siting Approval Permit.

7 Fees

Pursuant to the requirements in the Ordinance, the Applicant has provided the County a check for $50,000.00 to satisfy the Ordinance's requirement for a Plan Review Deposit, and a check for $119,000.00 to satisfy the Ordinance's requirement for a consideration fee of $1000.00 per turbine location proposed in this Application.

EXECUTIVE SUMMARY

Apex Clean Energy, Inc. ("Apex") has retained ArcVera Renewables ("ArcVera") to conduct a shadow flicker analysis for the proposed Lincoln Land wind farm located in Morgan County, Illinois. Apex provided a layout consisting of 119 GE 2.82-127 turbines with 114-m hub heights, which includes yet-to-be determined alternate turbines. Shadow flicker analysis is performed at 304 receptors near the turbine layout as provided.

Morgan County's wind ordinance requires that non-participating primary structures have less than 30 hours per year of shadow flicker, although the owner of the primary structure may waive that limitation. Two of the receptors exceed the total potential shadow flicker limit of 30 hours per year with a maximum of 82 minutes on a given day. One of the receptors is noted as a business in the data provided by Apex.

1 INTRODUCTION

Apex Clean Energy, Inc. ("Apex") has retained ArcVera Renewables ("ArcVera") to conduct shadow flicker analysis for the proposed Lincoln Land wind farm located in Morgan County, Illinois (Figure 1). Apex provided a layout consisting of 119 GE 2.82-127 turbines with 114-m hub heights, which includes yet-to-be determined alternate turbines. Shadow flicker analysis is performed at 304 receptors from the turbine layout as provided.

Figure 1. Continental view of proposed Lincoln Land wind farm, Illinois.

2 TURBINE ARRAY AND RECEPTORS

Apex provided the coordinates for the 119 Lincoln Land turbine locations (Table 1) and selected receptors (Table 2). Locations of the turbines and receptors are also illustrated in Figure 2.

The turbines are spread across relatively flat terrain in primarily agricultural areas, and the receptors are dispersed among and outside the array. More than 1200 total receptors were supplied by Apex. For this analysis, only receptors within 10 rotor diameters (1270 m) were evaluated for shadow flicker impact, with a total of 304 receptors. Receptors were also categorized as "participating" and "non-participating." There are 85 participating receptors and 219 non-participating receptors in this study.

Table 1. Coordinates for proposed Lincoln Land turbine array (WGS84 Datum, UTM Zone 15S).

3 WIND TURBINE SPECIFICATIONS

The GE 2.82-127 turbine is a three-bladed upwind turbine of International Electrotechnical Commission (IEC) Class S. The rotor diameter (RD) is 127 m, with a hub height of 114 m. Rated power for the GE 2.82-127 turbine is 2820 kW. The turbine has a cut-in and cut-out speed of 3.0 m/s and 30.0 m/s, respectively, and restart wind speed of 27.0 m/s. The turbine reaches rated power of 2820 kW at 12.0 m/s. The standard operating temperature range for the GE 2.82-127 turbine is -15°C to +40°C, while the cold temperature option has a range of -30°C to +40°C.

Apex provided multiple GE 2.82-127 power and thrust coefficients at sea-level air density for different noise reduction power curves that will be used at different turbine locations based upon subsequent analyses. For this analysis, since the power curve and thrust coefficients have little to no effect on the shadow flicker analysis, the standard normal operation specifications were used for the GE 2.82-127 turbine and are given in Table 3.

Table 3. GE 2.82-127 2.82 MW turbine power curve (Normal Operation) and thrust coefficients (from *Technical Documentation Wind Turbine Generator Systems 2.8-127 with LNTE - 60 Hz, Rev. 01 - EN 2018-11-06,* 06 November 2018).

4 SHADOW FLICKER MODELING

Shadow flicker modeling was conducted using Openwind software (version 01.08.00.2886). The key inputs included a digital topographic map, land cover map, turbine specifications (including power curves and thrust coefficients), and turbine and receptor locations.

Openwind contains an engine to download digital elevation data. For Lincoln Land, 30-m 1-Arc second elevation data was downloaded over a spatial domain between 39 and 40 degrees latitude and -89 to -91 degrees longitude. Similarly, 90-m 3-Arc second land cover data was downloaded over the same spatial domain.

Meteorological tower data was provided for and used in the analysis for a probabilistic model that considers turbine orientation. The wind frequency rose, of which a representative example is shown in Figure 3, is relatively omni-directional across the site.

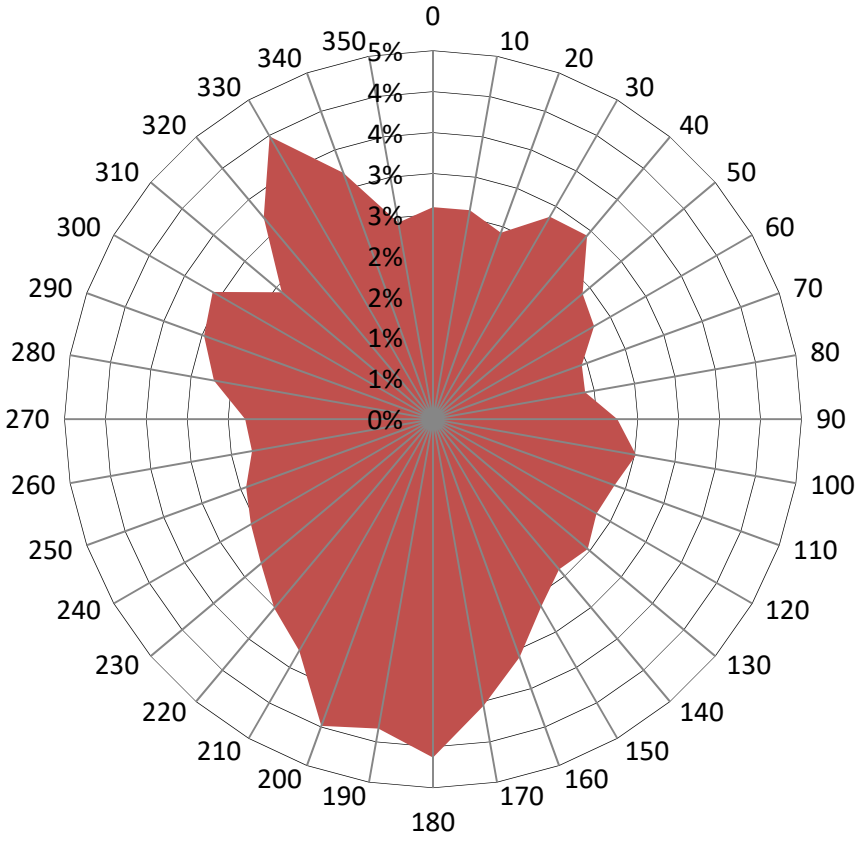

Figure 3. Site 4303 wind frequency rose.

Cloud cover was considered in this analysis by using the average monthly sunshine hours per day estimated using data from the NOAA's National Centers for Environmental Information (NCEI) from the Springfield, IL Capital Airport meteorological station. The input into Openwind was the percent of sunshine of the total available daylight hours per month. Table 4 presents the percentages used for each month.

Table 4. Percent of sunshine during daylight hours for Springfield, Illinois.

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Sunshine (%)	50	53	51	54	61	68	71	67	66	61	45	40

In addition, Apex provided a vegetation height layer that was included in the analysis. ArcVera has not verified the accuracy of this layer.

5 RESULTS

Shadow flicker was simulated in Openwind at the 304 receptor locations at a height of 1.75 m above ground level (approximate height of a person) for calendar year 2020 using the GE 2.82-127 turbine at the locations specified by Apex. The time zone was set for Central Standard Time (CST). Default settings were used for turbine availability (100%). Turbine orientation was considered based on the wind frequency distributions provided by Apex. The model also ignores shadow flicker when the sun is near the far horizon below 3 degrees. Percent sunshine during daylight hours were input using the values from Table 4.

Table 5 contains a summary of the number of days each receptor may be subject to shadow flicker, the total number of hours and minutes each year each receptor may be subject to shadow flicker, and the maximum number of minutes each receptor is subject to shadow flicker.

Unless waived, Morgan County's wind ordinance requires that non-participating primary structures have less than 30 hours per year of shadow flicker. Those that exceed this requirement are highlighted with blue coloring in Table 5, shown individually in Table 6, and displayed in Figure 4.

Table 5. Summary of shadow flicker simulation for receptors near the proposed Lincoln Land wind farm.

It is noted that Receptor 250 is listed as a business in the data provided by Apex.

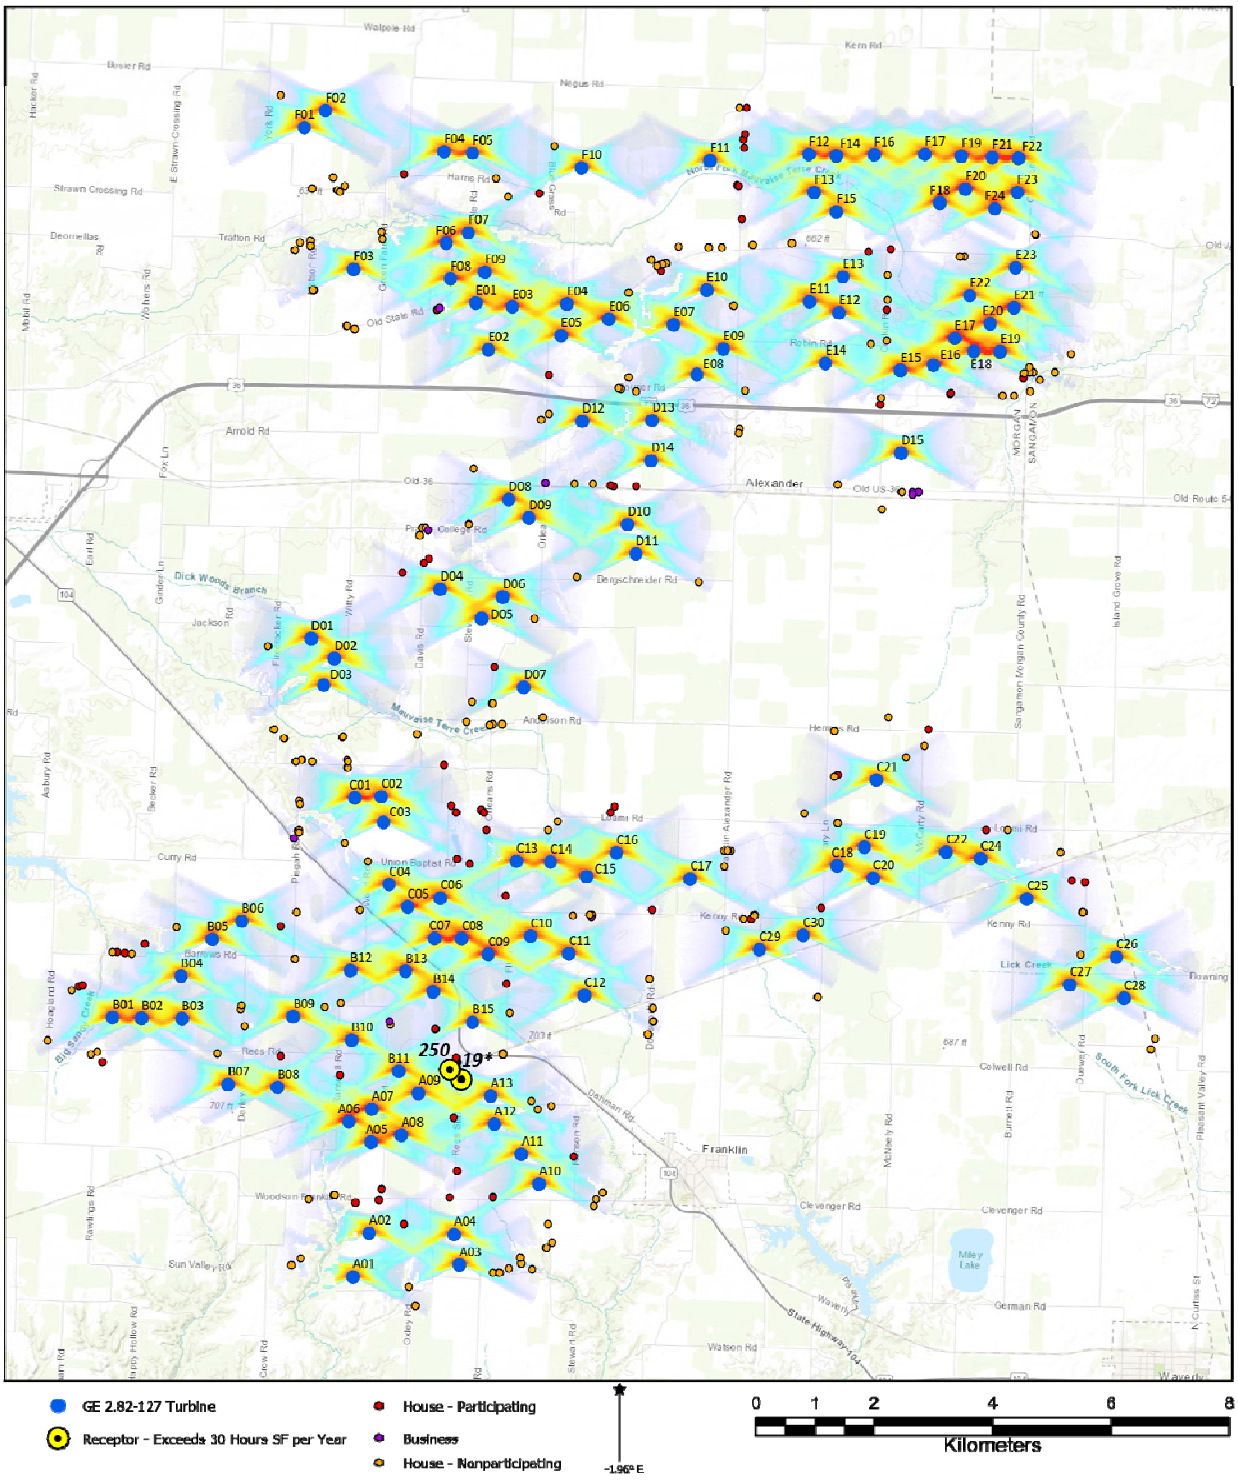

Figure 4. Shadow flicker for the proposed Lincoln Land turbine array (blue dots), businesses (purple dots), participating receptors (red dots), non-participating receptors (orange dots), and receptors that exceed 30 hours per year of shadow flicker (yellow/black dots).

6 CONCLUSIONS

A shadow flicker analysis was conducted at 304 receptor locations near the proposed Lincoln Land wind farm. Shadow flicker was simulated using GE 2.82-127 turbines with 114-m hub heights.

Two of the 304 receptors exceeded the total potential shadow flicker limit of 30 hours per year with a maximum of 82 minutes on a given day.

1.0 INTRODUCTION

The Lincoln Land Wind project (the “Project”) is a 300 MW nameplate capacity wind power generation facility proposed for Morgan County, Illinois. As part of the project’s application for a Morgan County Siting Approval Permit, RSG conducted sound propagation modeling for the proposed turbine array to assess compliance with county ordinances and Illinois Pollution Control Board standards. Included in this report are:

1. A project description;
2. An overview of ordinances and standards that apply to the project;
3. A description of sound propagation modeling procedures;
4. Sound propagation modeling results; and
5. Conclusions.

A primer on acoustical terminology is provided in Appendix A.

Acoustical issues specific to wind turbine noise are described in Appendix B.

2.0 PROJECT DESCRIPTION

The Lincoln Land Wind project (the “Project”) is a proposed 300 MW wind power generation facility located in Morgan County Illinois, spanning the Villages of Franklin, Alexander, and Pisgah. The eastern boundary of the Project is the Morgan-Sangamon county line. Land within the project area is rural and is primarily used for agriculture with some residence interspersed. Terrain is relatively flat, with some elevation change due to waterways in the southern and northwestern parts of the project area.

The Project is currently proposed to use General Electric (GE) 2.8 MW turbines with 127-meter rotor diameters and 114-meter hub heights, equipped with Low-Noise Trailing Edges (LNTE), although other turbine models are being considered. This turbine will be referred to as the GE2.8-127 LNTE, or just the GE2.8-127. A single transformer at the Collector and Point of Interconnect (POI) substation connects the turbine array to the electric grid. The Project area is shown in Figure 1, showing 119 turbine locations. Turbines will only be constructed at 107 of these locations.

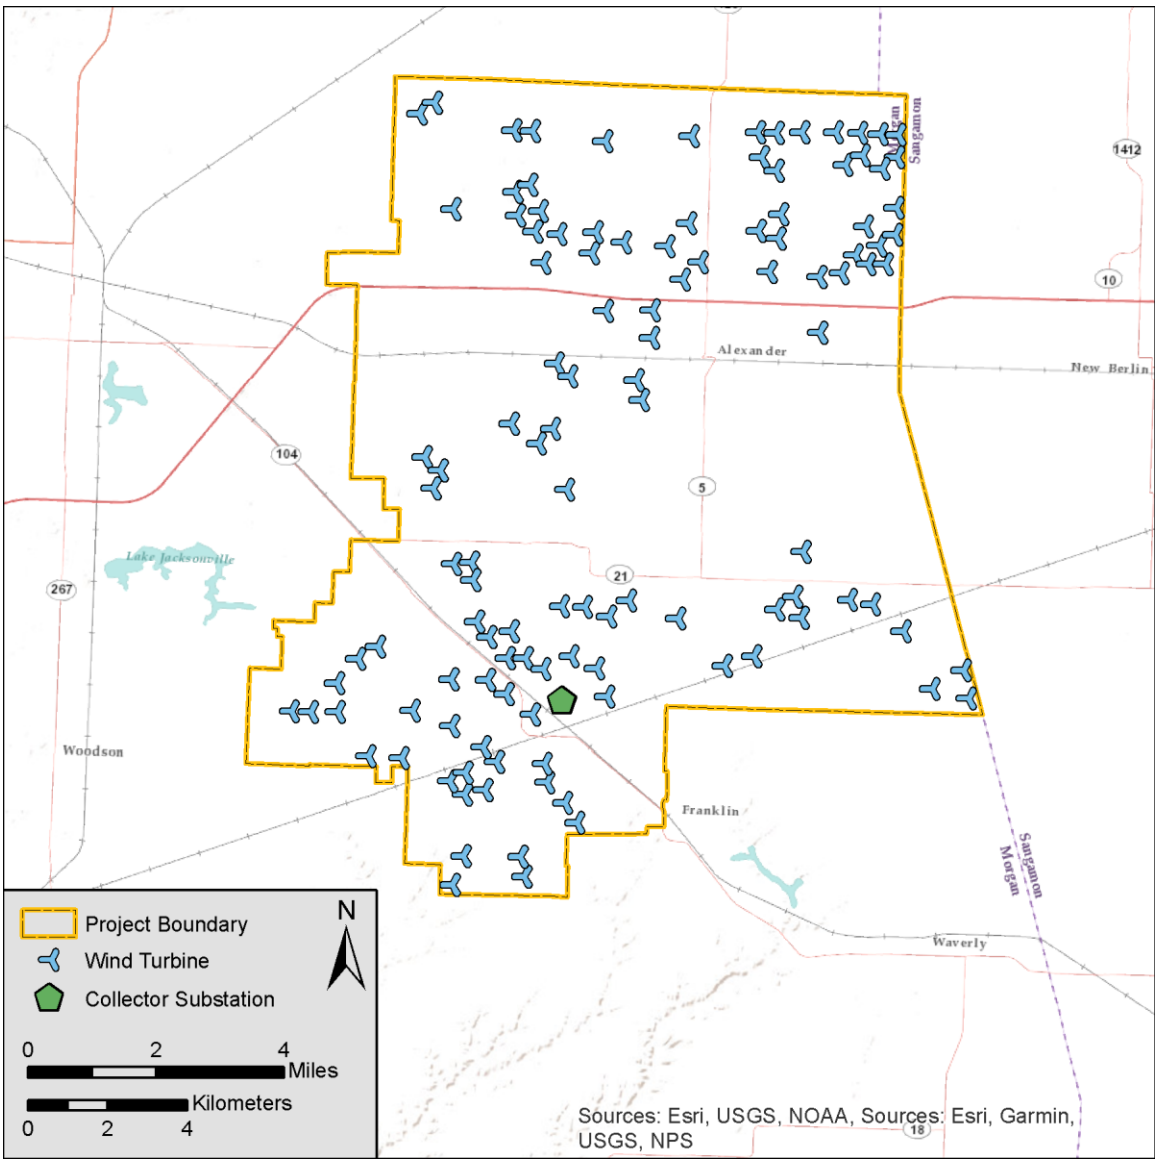

FIGURE 1: LINCOLN LAND WIND – PROJECT AREA MAP

3.0 NOISE STANDARDS

For this project, noise is regulated by the local Morgan County Commission. County regulations reference Illinois Pollution Control Board (IPCB) limits for sound sources. There are no federal noise regulations applicable to the Project.

3.1 LOCAL STANDARDS

Morgan County adopted an updated Wind Energy Conversion Systems Siting Regulations Ordinance in 2019 (No. 2019-10) that will be applied to the project. Section VI-M. limits noise from wind turbines as follows:

> *Noise levels from each WECS or WECS Project shall be in compliance with applicable Illinois Pollution Control Board (IPCB) regulations. The Applicant, through the use of a qualified professional, as part of the Siting Approval Permit application process, shall appropriately demonstrate compliance with the applicable noise requirements. The Applicant, at its expense, shall have a third party, qualified professional (after submission of resume and relevant work experience), conduct an appropriate analysis of the noise impact to nearby properties. The sound pressure level generated by a WECS shall comply with all Illinois Pollution Control Board (IPCB) noise regulations. A modeling analysis of the proposed site shall be included in the application predicting the sound pressure in accordance with the best available practices. The program generating the modeling must take into account not only topography, but also prevailing winds, temperature, air density, ground cover, and other effects which contribute to the distance that sound can travel. The modeling must be submitted to the County as part of the Siting Approval Permit application. A "0" background ambient noise level shall be used for all modeling.*

The local ordinance also discusses post-construction compliance monitoring. The Illinois Pollution Control Board (IPCB) noise standard referred to in the ordinance is detailed below. The intent of this report is to provide an analysis consistent with the requirements of the Morgan County Ordinance.

3.2 STATE STANDARDS

The State of Illinois regulates noise through Title 35, Subtitle H of the Illinois Administrative Code (the “Code”). In Section 900.102 the Code states:

> *No person shall cause or allow the emission of sound beyond the boundaries of his property, as property is defined in Section 25 of the Illinois Environmental Protection Act, so as to cause noise pollution in Illinois, or as to violate any provision of this Chapter.*

Noise pollution is defined in the Code as, “the emission of sound that unreasonably interferes with the enjoyment of life or with any lawful business or activity.”

Part 910 details basic measurement procedures with references to several ANSI standards.

Quantitative sound level limits that are applicable to the proposed project are defined in Part 901: “Sound Emission Standards and Limitations for Property Line-Noise-Sources.” Section

901.102 and 901.103 provide sound pressure level limits for each full octave band center frequency from 31.5 Hz to 8 kHz.

The IPCB standard is based on the land use of the sound source and receiver. Both wind power projects and agriculture are considered Class C. Residences are considered Class A. Impacts to individual residences, and the land immediately surrounding them are evaluated according to the Class C to Class A standard. The applicable standards are shown in Table 1.

It is important to point out that the Illinois standard is frequency based, and thus is intended to protect against specific low-frequency noise impacts, as well as impacts due to overall sound levels.

TABLE 1: ALLOWABLE OCTAVE BAND SOUND PRESSURE LEVELS (dBZ) OF SOUND EMITTED TO RECEIVING CLASS A LAND FROM CLASS C LAND

LIMIT TIME	OCTAVE BAND CENTER FREQUENCY (dBZ)								
	31.5 Hz	63 Hz	125 Hz	250 Hz	500 Hz	1 kHz	2 kHz	4 kHz	8 kHz
Class C to A Daytime	75	74	69	64	58	52	47	43	40
Class C to A Nighttime	69	67	62	54	47	41	36	32	32

Additionally, the regulation states that “no person shall cause or allow the emission of any prominent discrete tone.” In Section 900.101, the Code defines prominent discrete tones as:

> *Prominent discrete tone: sound, having a one-third octave band sound pressure level which, when measured in a one-third octave band at the preferred frequencies, exceeds the arithmetic average of the sound pressure levels of the two adjacent one-third octave bands on either side of such one-third octave band by:*
>
> *5 dB for such one-third octave band with a center frequency from 500 Hertz to 10,000 Hertz, inclusive. Provided: such one-third octave band sound pressure level exceeds the sound pressure level of each adjacent one-third octave band, or;*
>
> *8 dB for such one-third octave band with a center frequency from 160 Hertz to 400 Hertz, inclusive. Provided: such one-third octave band sound pressure level exceeds the sound pressure level of each adjacent one-third octave band, or;*
>
> *15 dB for such one-third octave band with a center frequency from 25 Hertz to 125 Hertz, inclusive. Provided: such one-third octave band sound pressure level exceeds the sound pressure level of each adjacent one-third octave band.*

The regulation also adds the following clause for prominent discrete tones:

> *This rule shall not apply to prominent discrete tones having a one-third octave band sound pressure level 10 or more dB below the allowable octave band sound pressure level specified in Sections 901.102 through 901.104 for the octave band which contains such one-third octave band. In the application of this sub-section, the applicable numeric standard for sound emitted from any existing property-line-noise-source to receiving Class A land, for both daytime and nighttime operations, is found in Section 901.102(a).*

Each residence whether participating or nonparticipating has been evaluated using the nighttime Class C to Class A limits and for the presence of prominent discrete tones.

4.0 SOUND PROPAGATION MODELING

4.1 PROCEDURES

Modeling for the Project was performed in accordance with the standard ISO 9613-2, “Acoustics – Attenuation of sound during propagation outdoors, Part 2: General Method of Calculation.” The ISO standard states,

> This part of ISO 9613 specifies an engineering method for calculating the attenuation of sound during propagation outdoors in order to predict the levels of environmental noise at a distance from a variety of sources. The method predicts the equivalent continuous A-weighted sound pressure level … under meteorological conditions favorable to propagation from sources of known sound emissions. These conditions are for downwind propagation … or, equivalently, propagation under a well-developed moderate ground-based temperature inversion, such as commonly occurs at night.

The model takes into account source sound power levels, surface reflection and absorption, atmospheric absorption, geometric divergence, meteorological conditions, walls, barriers, berms, and terrain. The acoustical modeling software used here was CadnaA® 2019 MR2 from Datakustik GmbH. CadnaA® is a widely accepted acoustical propagation modeling tool, used by many noise control professionals in the United States and internationally.

ISO 9613-2 also assumes downwind sound propagation between every source and every receiver. Consequently, all wind directions, including the prevailing wind directions, are taken into account. The project area was modeled with mixed ground porosity (G=0.5). Otherwise, no reflections (such as due to buildings) were considered. Foliage was not modeled. Atmospheric absorption was based on 10˚C and 70% relative humidity and source contributions were considered up to 8,000 meters (5 miles) from each receiver.

Turbines were modeled with a 2 dB factor in addition to the manufacturer specified apparent sound power. All turbine data used is the most recent available from the manufacturer.

A 30-meter by 30-meter grid of 4 meter (13.1 feet) high receivers was set up in the model, covering approximately 860 sq. km. (332 sq. mi.) in and around the project area. The model was laid over the USGS Digital Terrain Model to give accurate elevations throughout.

A total of 888 discrete receivers were included in the model at a 4-meter (13 foot) height, representing residences and other structures near the Project. Receivers in both Morgan County and Sangamon County were modeled. Additionally, results were calculated at a 33-meter (100 foot) radius from the center of each receiver to approximate the yard boundary of each receiver.

Results calculated with these parameters represent the highest 1-hour equivalent sound level that will be emitted by the Project.

4.2 SOUND SOURCES

Wind Turbines

All 119 turbine locations shown in Figure 1 were modeled. A maximum of 107 of these locations are expected to be built. The GE2.8-127 Low Noise Trailing Edge (LNTE) turbine was modeled for this report. Other turbine models are also being considered for this project. This model has relatively high overall sound emissions, so it was modeled as a conservative assumption. If a different turbine model is selected, a revised modeling report will be produced using the selected turbine. All turbines were modeled at the maximum A-weighted sound power that is emitted by that turbine model unless octave band sound level limit exceedances were encountered. To mitigate exceedances of the IPCB limits, Noise Reduced Operation (NRO) modes were used. NRO reduces the sound power of turbines, usually by slowing down the rotational speed of the turbine's rotor. Specific NRO plans may include provisions for different NRO settings to be used depending on the time of day and meteorological conditions, if needed. The turbine model currently proposed for the project includes three NRO modes, which are referred to here as NRO Mode 1, NRO Mode 2, NRO Mode 3, where NRO Mode 3 represents the greatest reduction in sound power level as a result of the noise reduced operation. Exact source locations are indicated in Appendix C.

Project Transformer

The proposed collector and POI substation transformer will be located in the southern portion of the project area (see Figure 1). A 34.5 to 345 kV step-up transformer is proposed, with 166 MVA and 200/1050 kV BIL.

The sound emissions data used for modeling is from a test performed by the transformer manufacturer (GE Prolec). The condition modeled is fans on (ONAF or Oil Natural Air Forced) condition. The fans-off condition (ONAN or Oil Natural Air Natural) condition will typically be quieter, though it often has higher tonal prominence.

4.3 RESULTS

Octave Band Sound Levels

To accommodate the array as designed and the IPCB nighttime noise limits, a total of 47 turbines are required to be operated in NRO at night (Table 2). The highest sound level at a receiver or buffer receiver, does not exceed the IPCB C to A nighttime 1/1 octave band limits assuming NROs are applied. Sound levels are closest to IPCB C to A nighttime limits in either the 1,000 Hz or 2,000 Hz 1/1 octave bands. The IPCB daytime octave band limits are met without any mitigation, that is, no NROs are needed during the day. Only mitigated nighttime results are presented here.

TABLE 2: SUMMARY OF NOISE REDUCED OPERATIONS FOR NIGHTTIME OPERATIONS

OPERATION MODE	NUMBER OF TURBINES
Normal Operation	72
NRO Mode 1	8
NRO Mode 2	14
NRO Mode 3	25

The results for the mitigated nighttime operation scenario are shown for each octave band in Figures 2 to 10. In each figure, the IPCB sound limit is highlighted as a dashed purple isoline. The standard is different for each octave band. If the sound levels shown on the map never reach the standard level, then no limit contour is shown. Note that these results, like the IPCB sound level limits, are not weighted to approximate the relative sensitivity of the human ear to different sound frequencies. For example, the human ear is approximately 57 dB more sensitive at 1 kHz around the threshold of hearing than it is for the 31.5 Hz 1/1 octave band. This means that a sound around the IPCB limit in the 31.5 Hz 1/1 octave band would be perceived at a similar magnitude as a 12 dB sound in the1 kHz 1/1 octave band. This isn't to say that the 31.5 Hz 1/1 octave band sound would not be noticeable or is irrelevant. What it does mean is that sounds at 50, 60, or 70 dB sounds in the low frequency region are not perceived as loud as similar magnitude sounds in the mid- to upper-frequency range. Octave band sound levels for each receiver are provided in Appendix D.

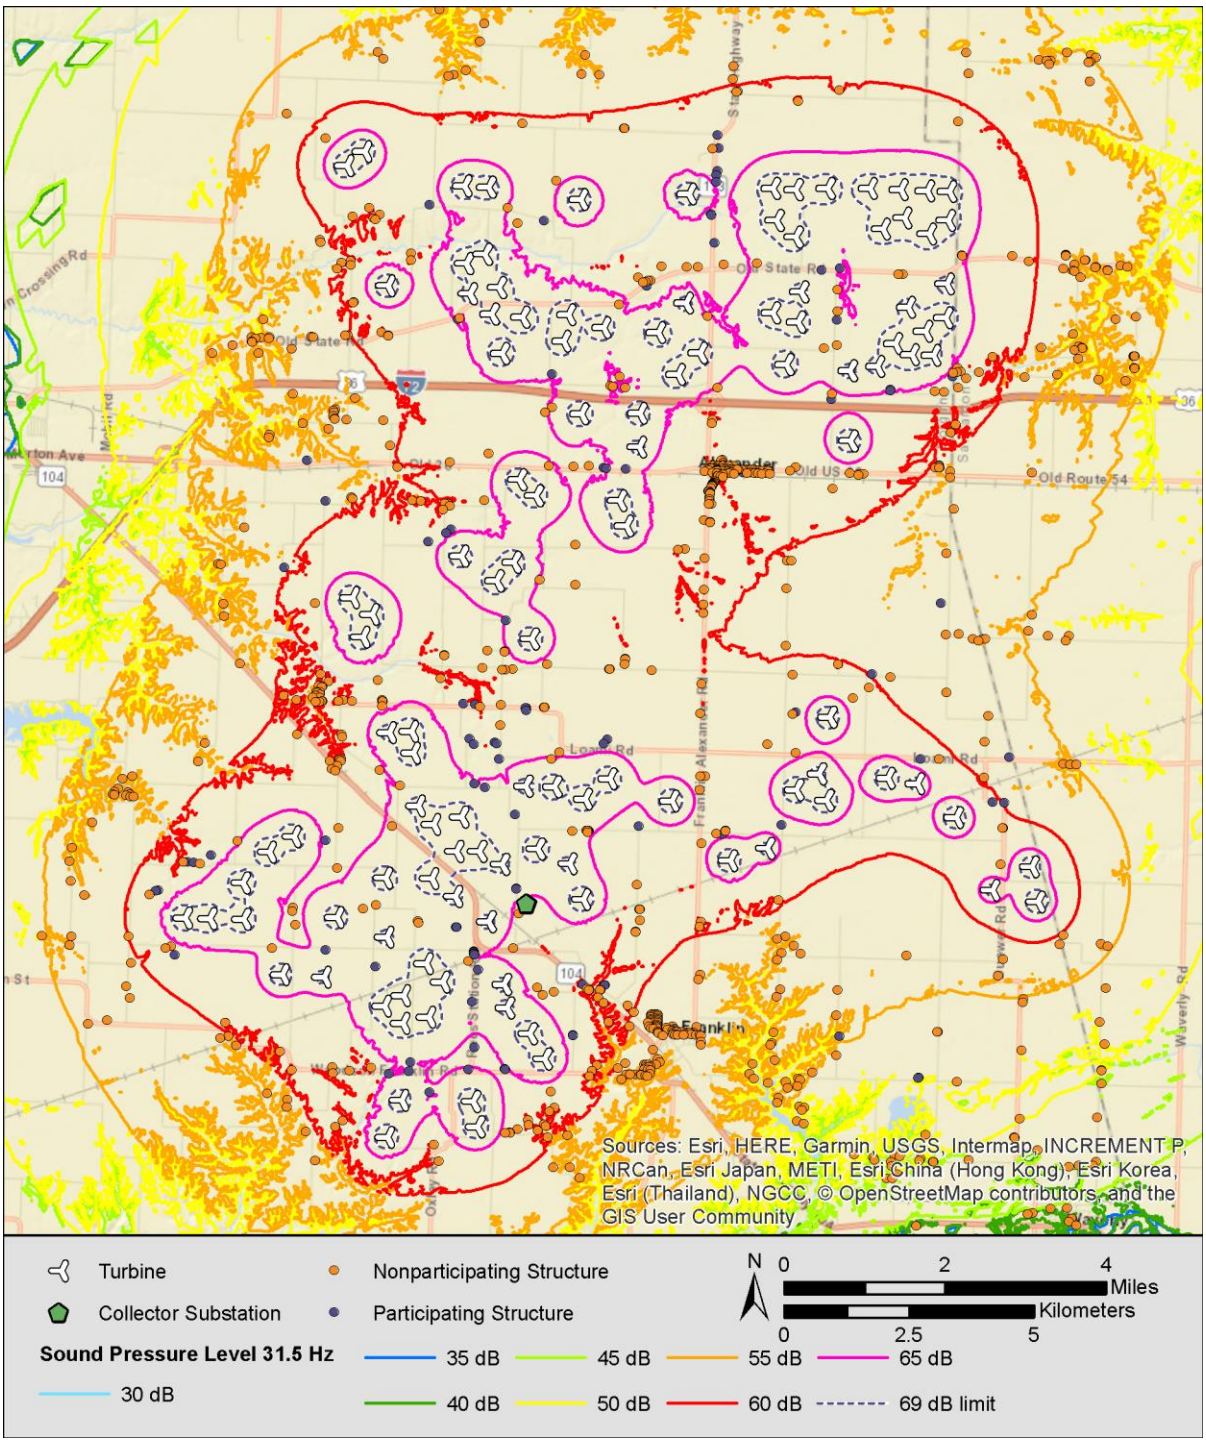

FIGURE 2: SOUND PROPAGATION MODELING RESULTS – 31.5 Hz 1/1 OCTAVE BAND

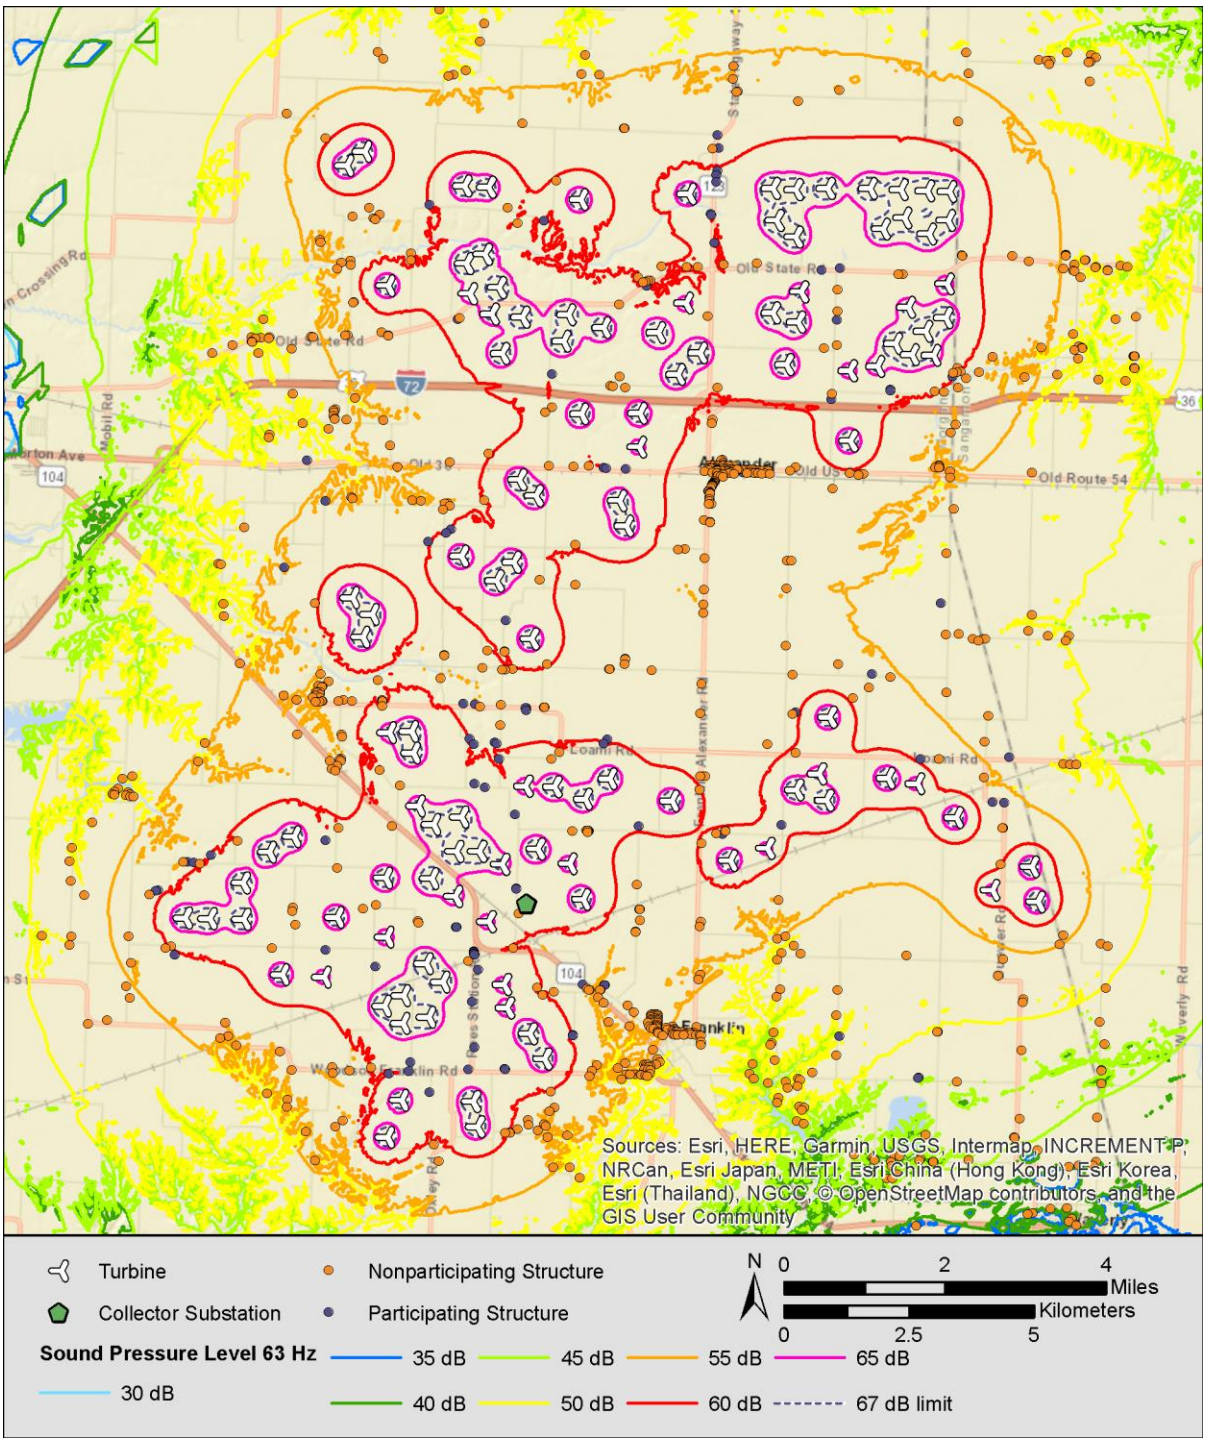

FIGURE 3: SOUND PROPAGATION MODELING RESULTS – 63 Hz 1/1 OCTAVE BAND

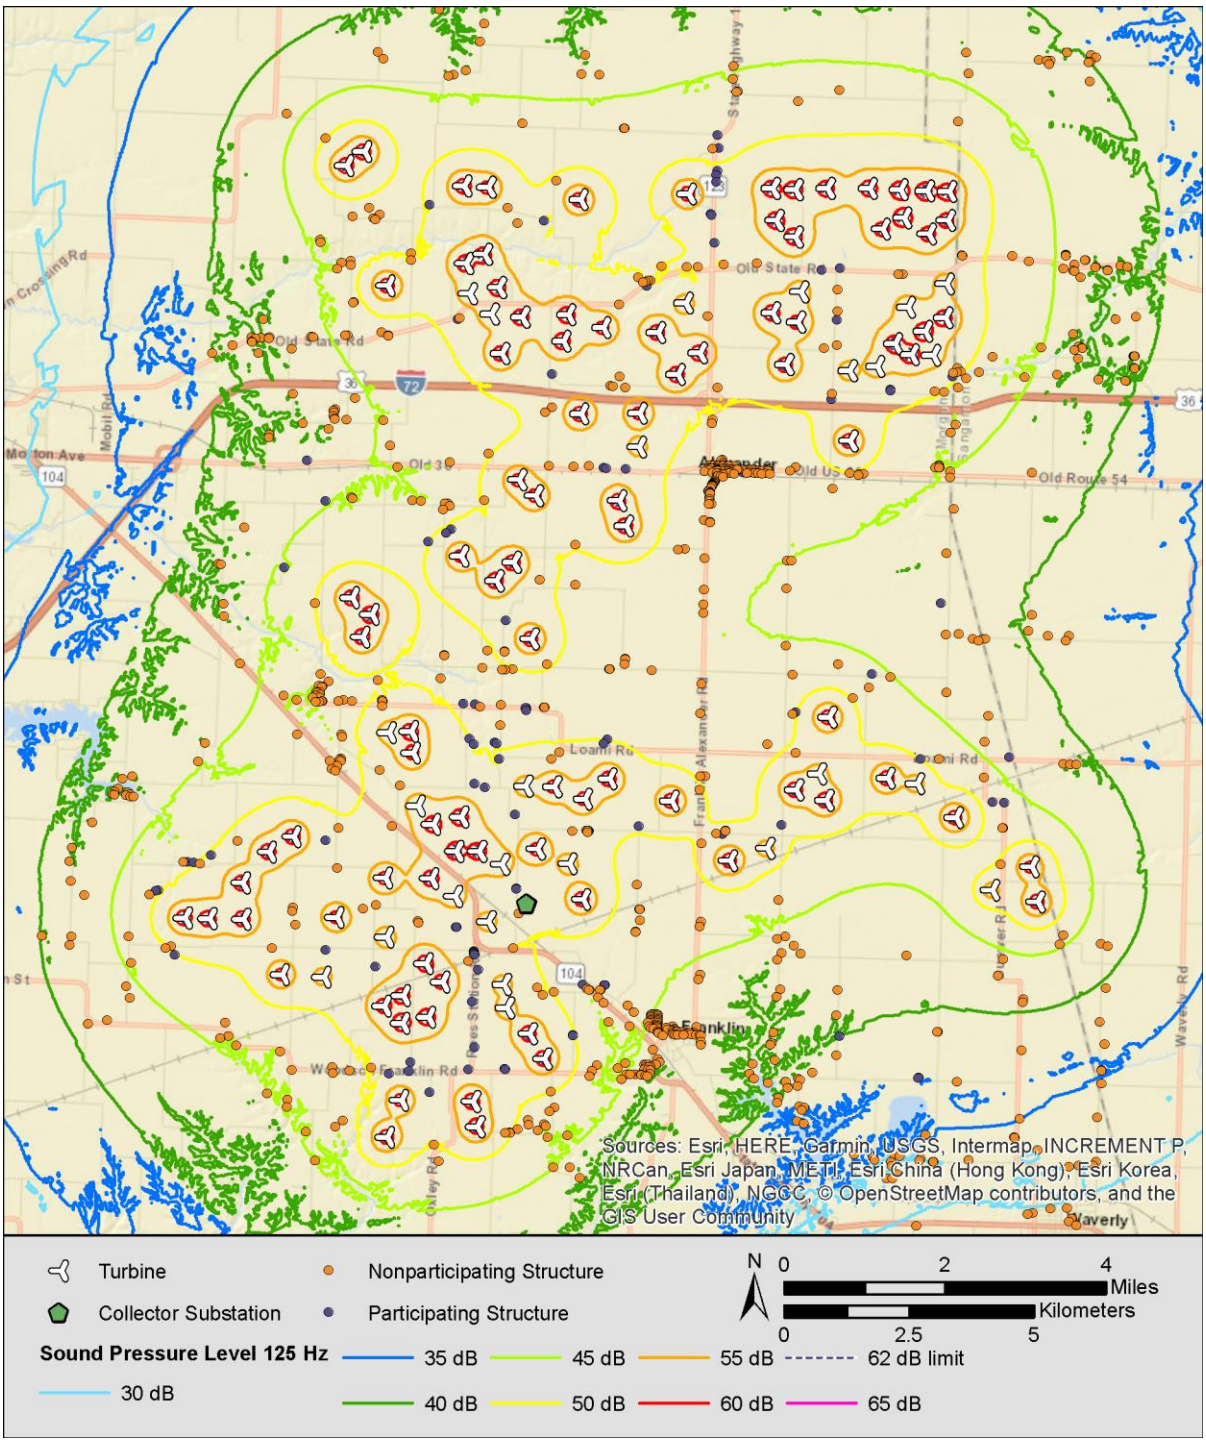

FIGURE 4: SOUND PROPAGATION MODELING RESULTS – 125 Hz 1/1 OCTAVE BAND

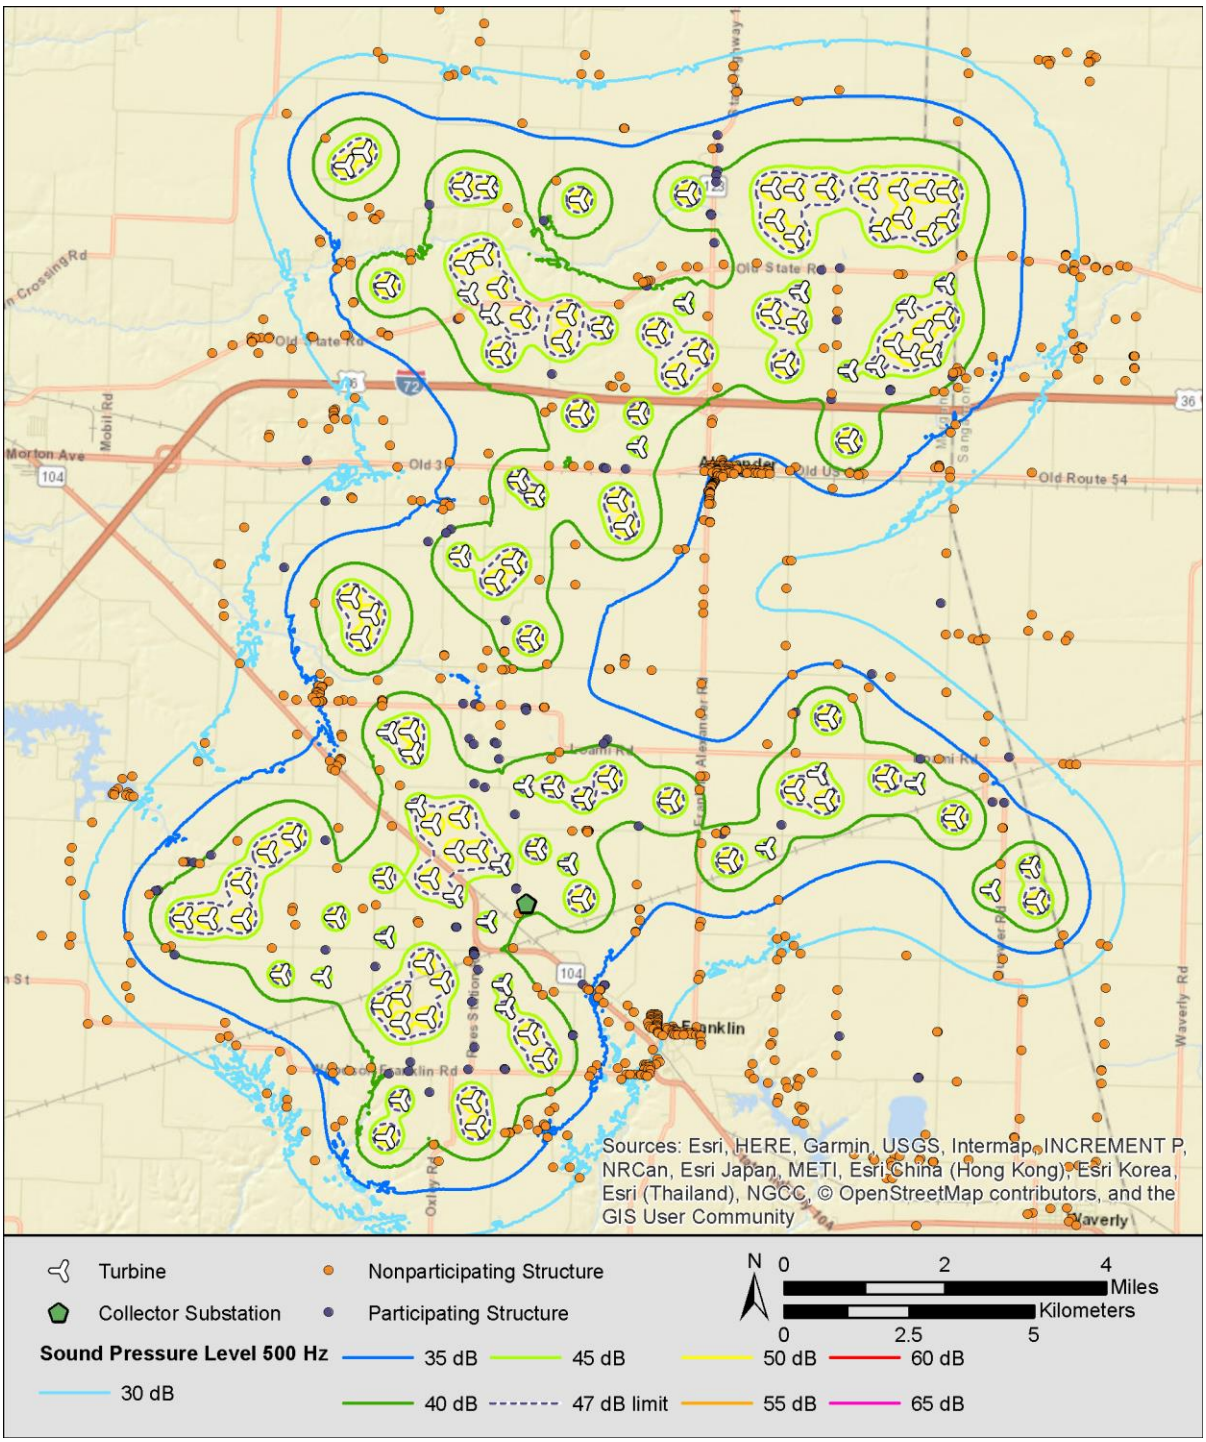

FIGURE 6: SOUND PROPAGATION MODELING RESULTS – 500 Hz 1/1 OCTAVE BAND

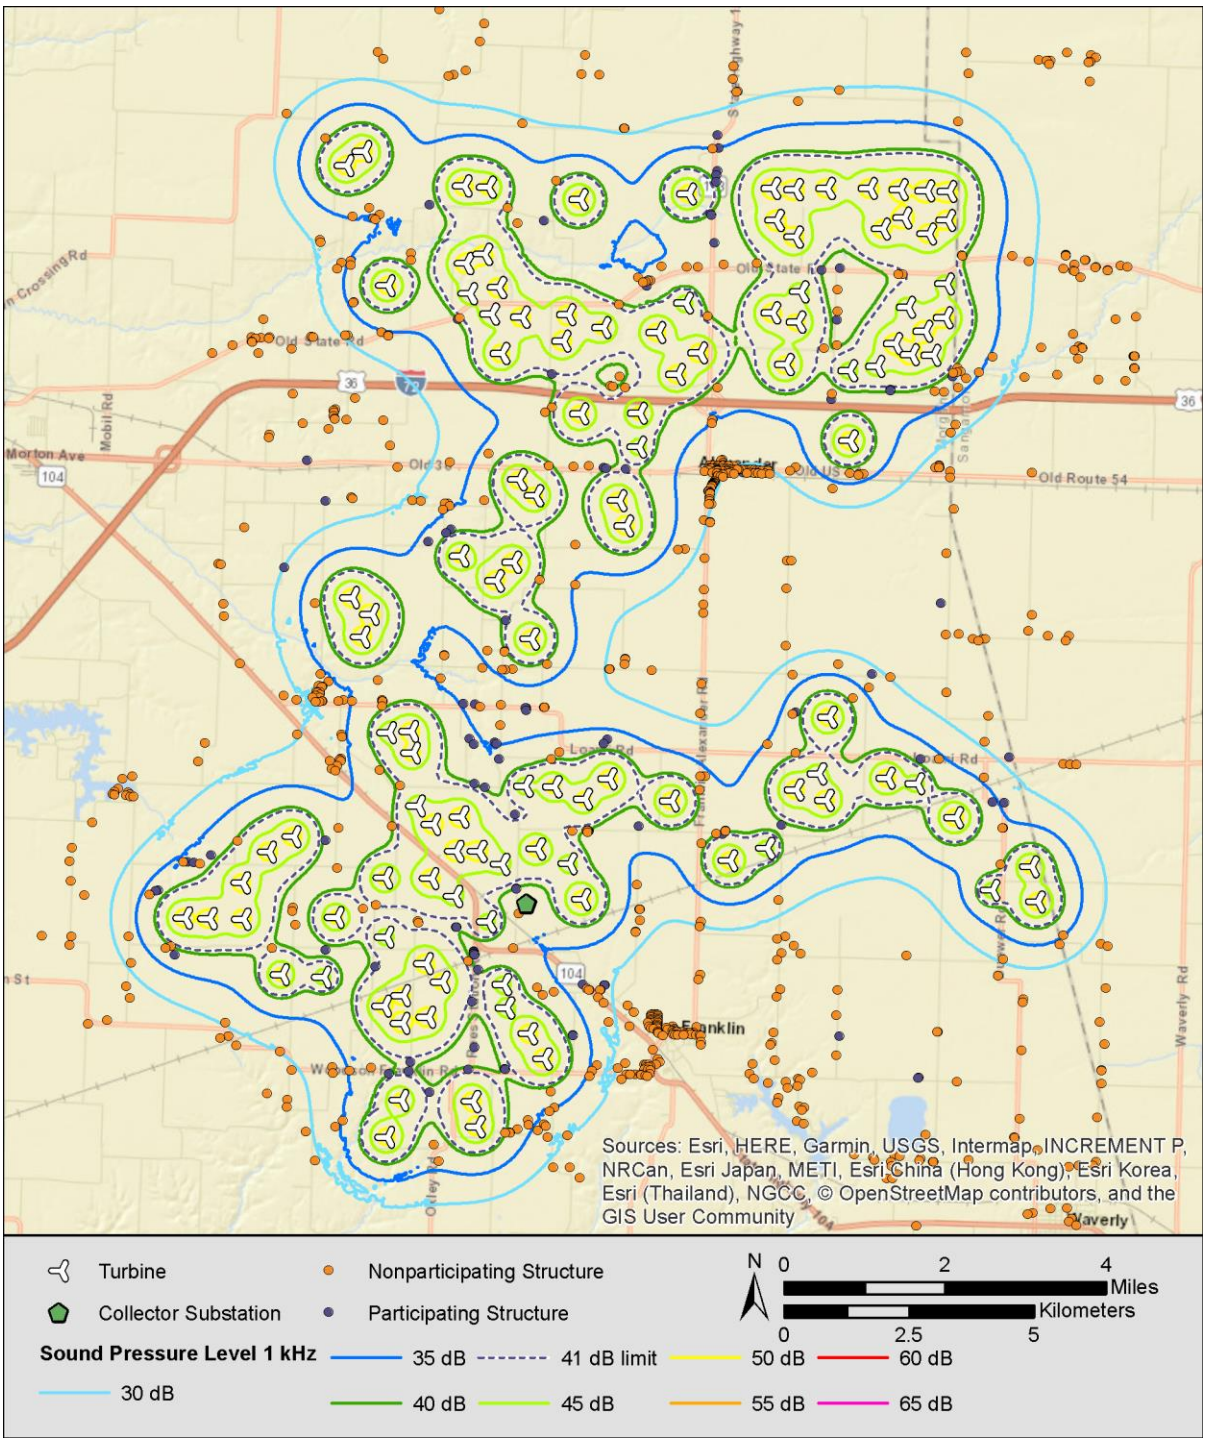

FIGURE 7: SOUND PROPAGATION MODELING RESULTS – 1 kHz 1/1 OCTAVE BAND[1]

[1] Due to the scale of these maps some receivers may appear to be at or over the sound level limit. Close-up maps of some areas for the 1 kHz 1/1 octave band where this is the case are shown in Appendix E.

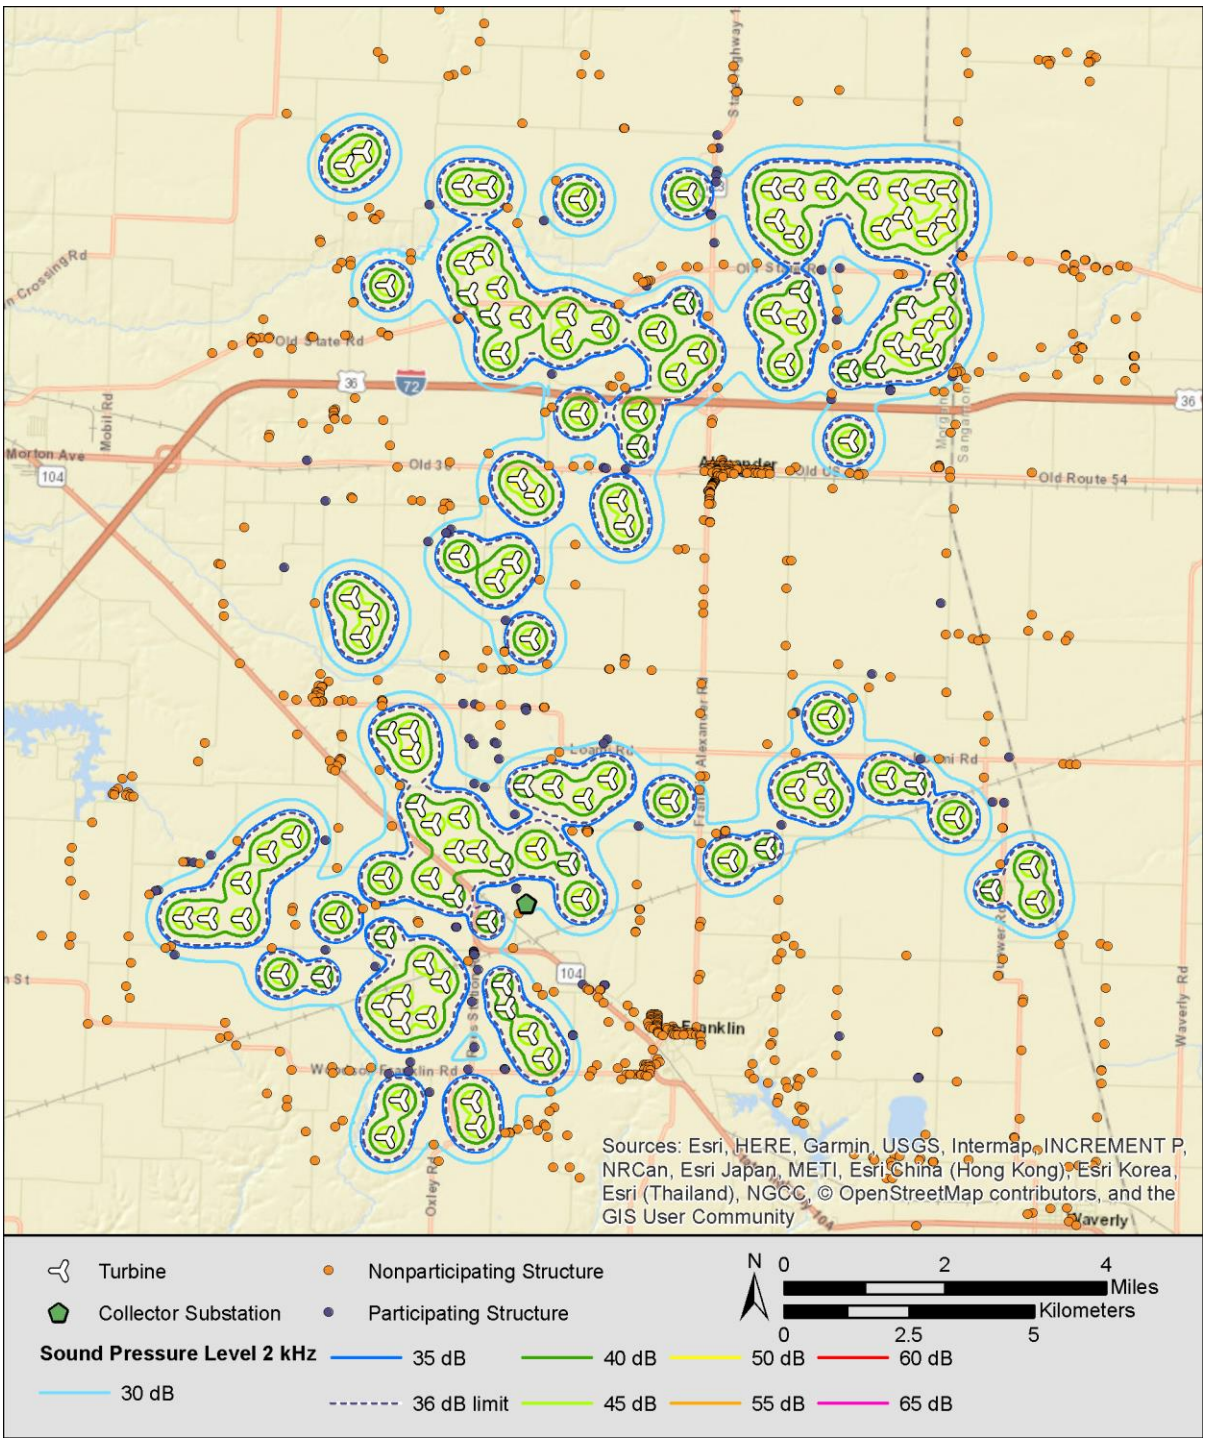

FIGURE 8: SOUND PROPAGATION MODELING RESULTS – 2 kHz 1/1 OCTAVE BAND

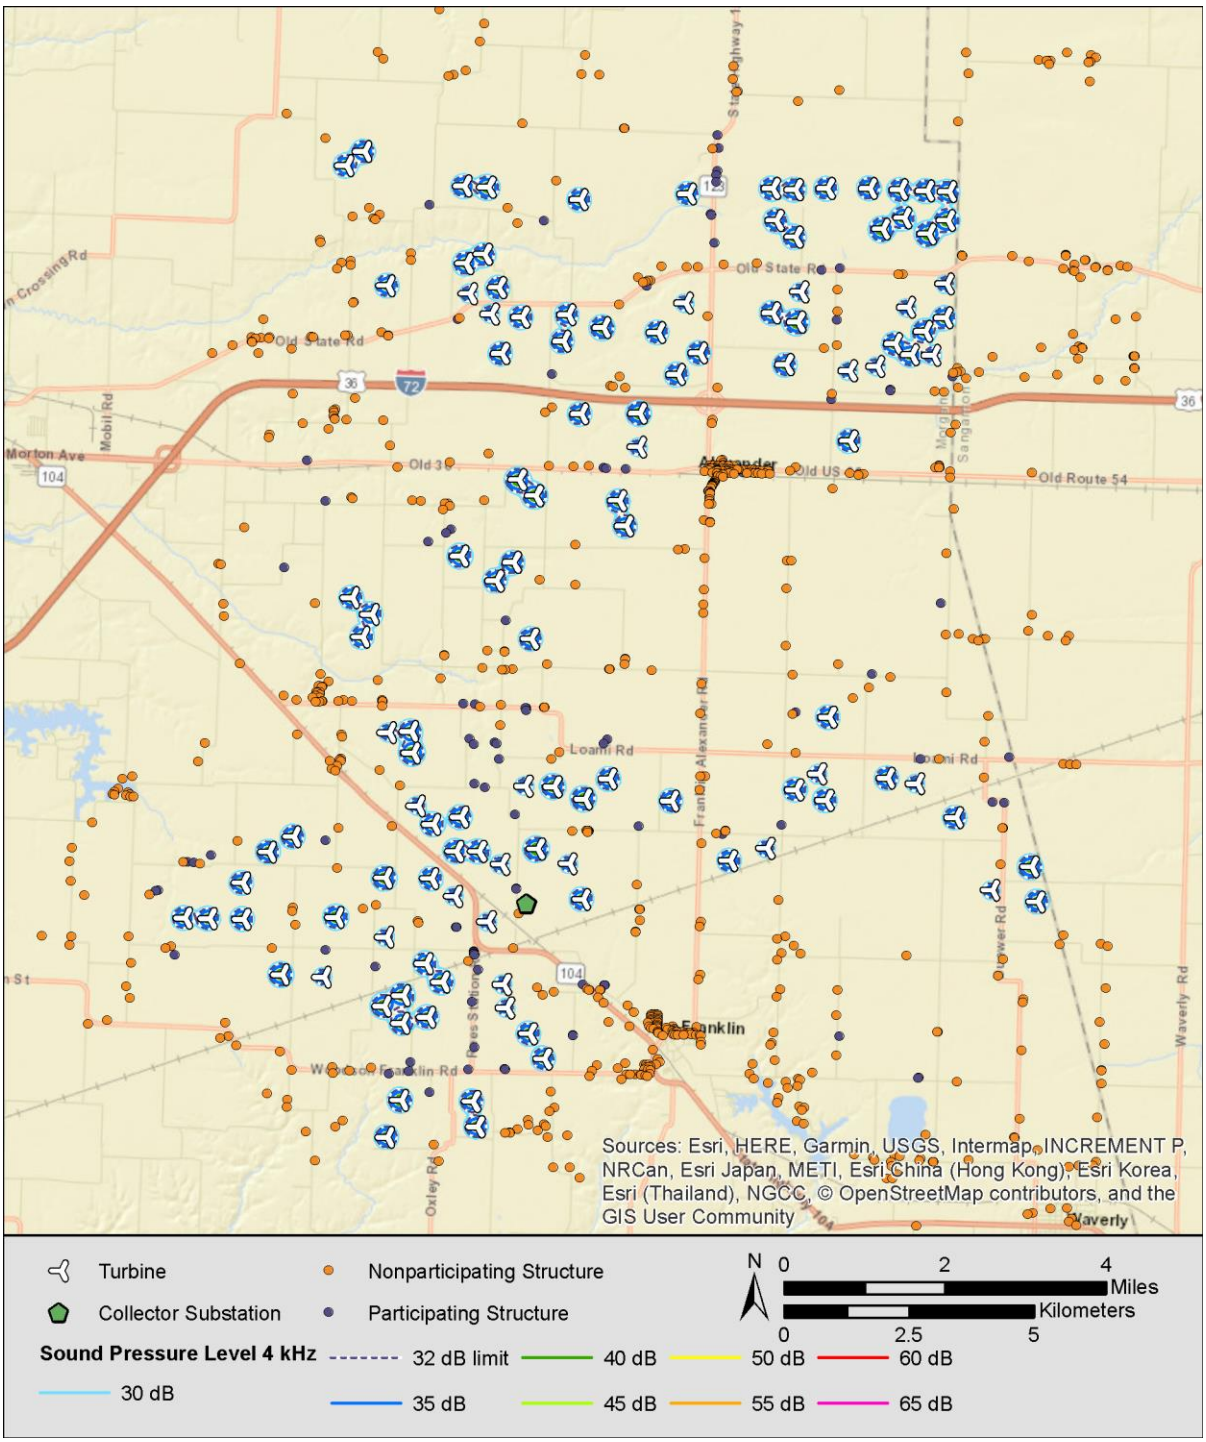

FIGURE 9: SOUND PROPAGATION MODELING RESULTS – 4 kHz 1/1 OCTAVE BAND

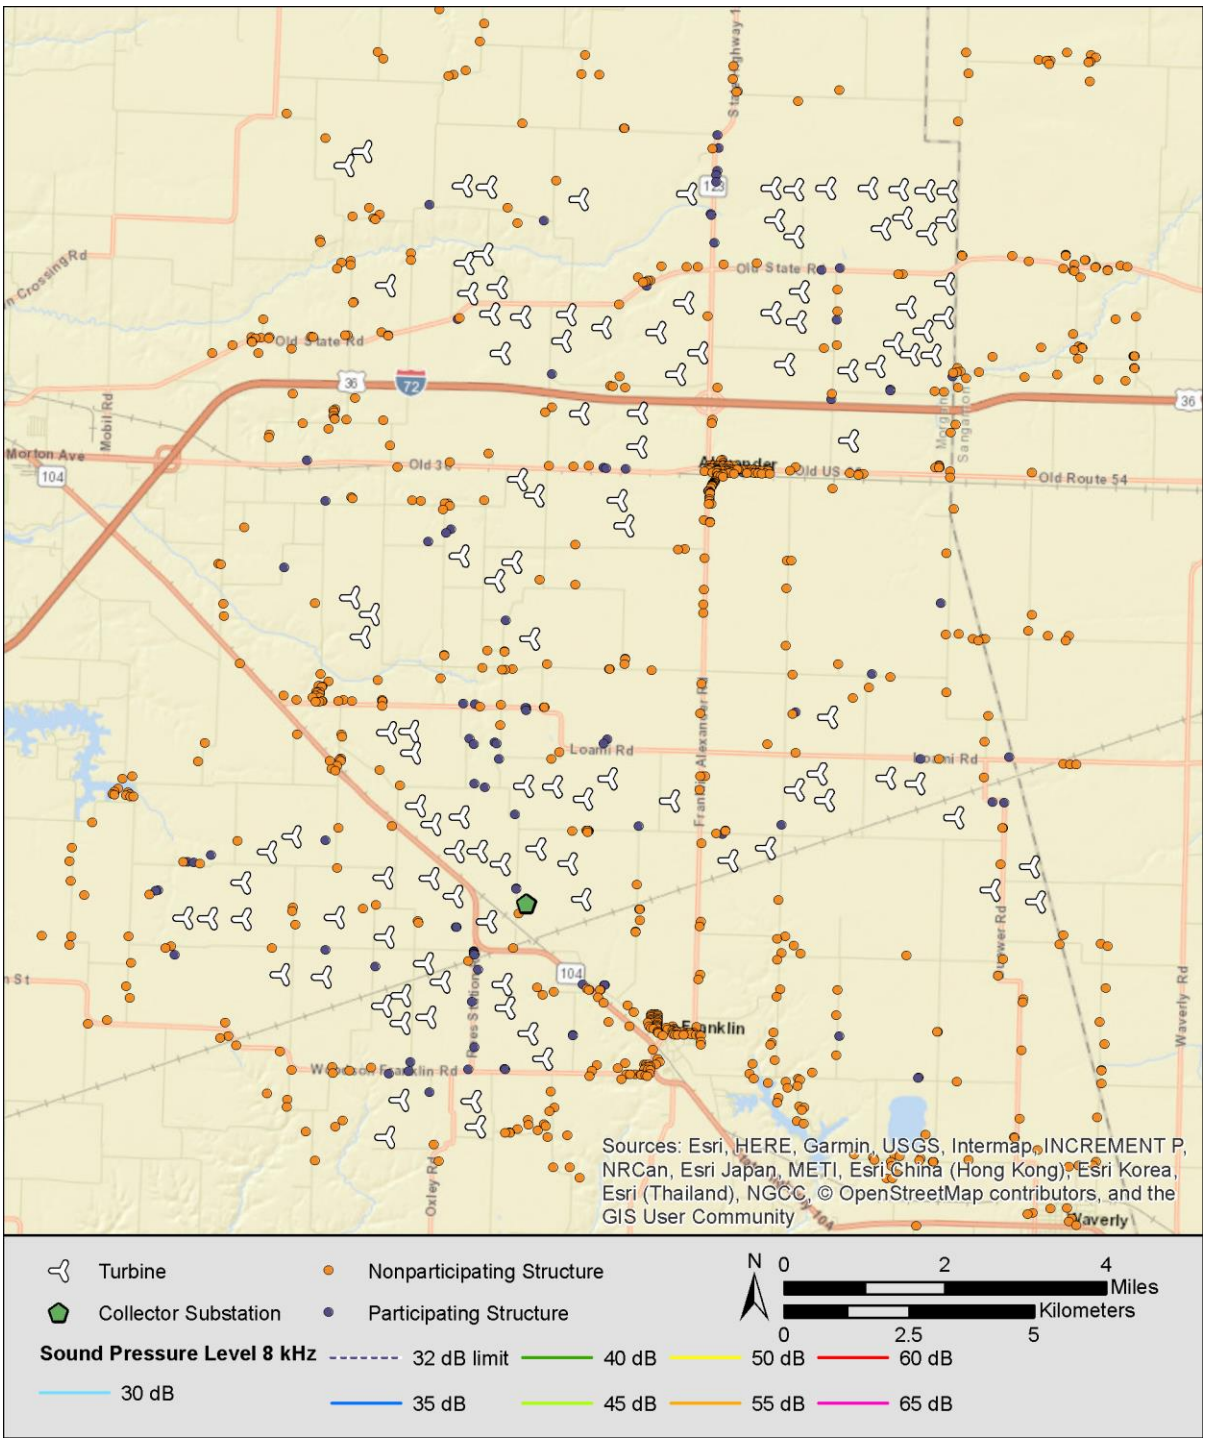

FIGURE 10: SOUND PROPAGATION MODELING RESULTS – 8 kHz 1/1 OCTAVE BAND

Tonality

The tonal audibility of this turbine is reported by the manufacturer as less than or equal to 4 dB, however this is assessed using a different method than the IPCB standard, so it is not directly comparable. Figure 11 shows the tonal prominence of the GE 2.8-127 turbine, using the IPCB method, compared with the IPCB tonality criteria. This indicates that sound power spectrum of the GE 2.8-127 is below the IPCB tonality criteria.

The transformer in the Project substation has the potential to generate prominent discrete tones. The 1/1 octave band sound pressure level due to the transformer at the two receivers closest to the project substation are plotted in Figure 12. The sound levels in the figure do not include the contribution from any wind turbines. The figure shows that modeled sound levels below the 1 kHz 1/1 octave band were at least 10 dB below the corresponding IPCB limit. The clause for prominent discrete tones allows for the existence of prominent discrete tones when they are 10 dB below the corresponding octave band limit. Since the ONAF condition is shown, fans will mask tonal prominence, so this spectrum will not be tonal. Sound levels for the ONAN condition, which will exhibit greater tonal prominence, will be lower still and not within 10 dB of the IPCB limit.

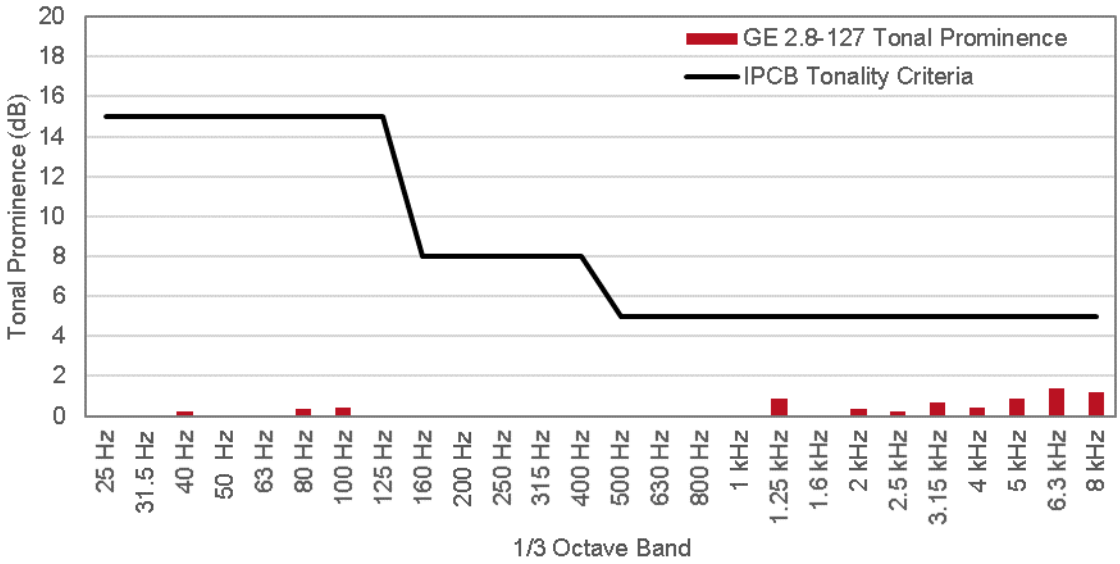

FIGURE 11: REPORTED 1/3 OCTAVE BAND TONAL PROMINENCE COMPARED TO IPCB TONALITY CRITERIA

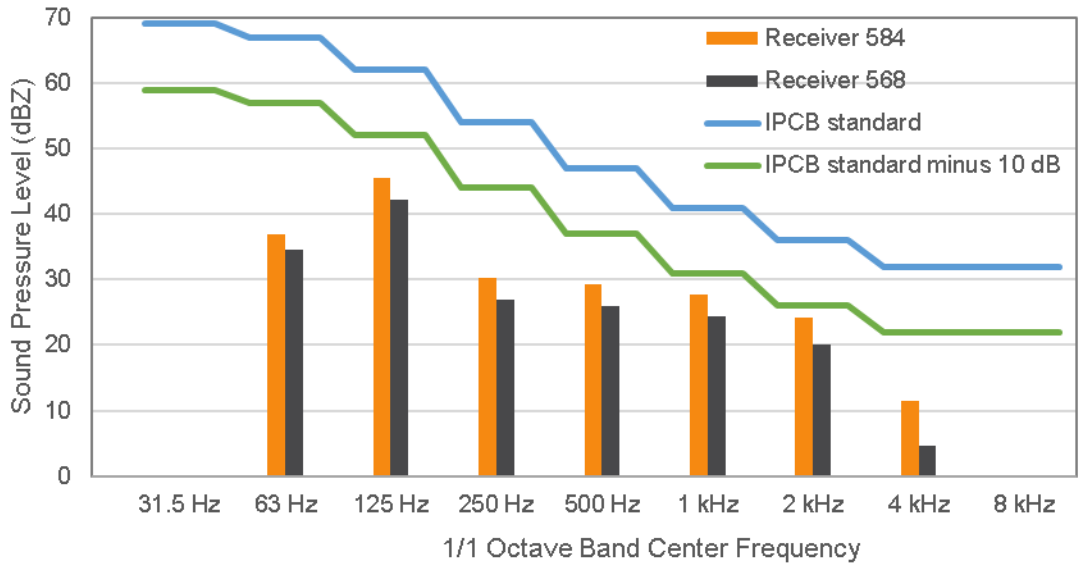

FIGURE 12: MAXIMUM 1/1 OCTAVE BAND SOUND LEVELS FROM PROJECT TRANSFORMER AT THE NEAREST RECEIVER DURING ONAF COOLING COMPARED TO IPCB LIMITS

5.0 CONCLUSIONS

RSG performed sound propagation modeling of the proposed Lincoln Land Wind project in Morgan County, Illinois in preparation for the project's Siting Approval Permit application.

Conclusions for the sound modeling for this project are as follows:

- The array consists of 119 GE 2.8-127 LNTE wind turbines on a 114-meter tower, of which at least 12 are spares. A maximum of 107 turbine locations are expected to be built. Other turbine models are also being considered. The GE 2.8-127 LNTE turbine is being modeled as a conservative assumption due to its relatively high sound power.
- Sound propagation modeling was performed ISO 9613-2, implemented in the Cadna/A modeling package. The project was modeled with mixed ground porosity (G=0.5) and a 2 dB factor added on top of the manufacturer apparent sound power level. Results are compared to the Illinois Pollution Control Board (IPCB) limits, which are referenced by Morgan County regulations.
- A total of 47 turbines require NRO to meet the IPCB nighttime 1/1 octave band limits. With this prescribed noise mitigation scheme, the sound levels are at or below IPCB C to A nighttime standards at and within 100 feet (30 meters) all receivers. This number may change due to more current turbine information or turbine location shifts.
- Sound propagation modeling of the current layout and turbine model indicated that the project complies with IPCB C to A daytime 1/1 octave band limits at all receivers without any mitigation applied.
- The project is also not expected to exceed IPCB tonality criteria. This is due to low tonal prominence exhibited by the proposed turbine and lower overall transformer sound levels at the closest receivers to the substation.

APPENDIX A. PRIMER ON SOUND

Expressing Sound in Decibel Levels

The varying air pressure that constitutes sound can be characterized in many different ways. The human ear is the basis for the metrics that are used in acoustics. Normal human hearing is sensitive to sound fluctuations over an enormous range of pressures, from about 20 micropascals (the "threshold of audibility") to about 20 pascals (the "threshold of pain").[2] This factor of one million in sound pressure difference is challenging to convey in engineering units. Instead, sound pressure is converted to sound "levels" in units of "decibels" (dB, named after Alexander Graham Bell). Once a measured sound is converted to dB, it is denoted as a level with the letter "L".

The conversion from sound pressure in pascals to sound level in dB is a four-step process. First, the sound wave's measured amplitude is squared and the mean is taken. Second, a ratio is taken between the mean square sound pressure and the square of the threshold of audibility (20 micropascals). Third, using the logarithm function, the ratio is converted to factors of 10. The final result is multiplied by 10 to give the decibel level. By this decibel scale, sound levels range from 0 dB at the threshold of audibility to 120 dB at the threshold of pain.

Typical sound sources, and their sound pressure levels, are listed on the scale in Figure 13.

Human Response to Sound Levels: Apparent Loudness

For every 20 dB increase in sound level, the sound pressure increases by a *factor* of 10; the sound *level* range from 0 dB to 120 dB covers 6 factors of 10, or one million, in sound *pressure*. However, for an increase of 10 dB in sound *level* as measured by a meter, humans perceive an approximate doubling of apparent loudness: to the human ear, a sound level of 70 dB sounds about "twice as loud" as a sound level of 60 dB. Smaller changes in sound level, less than 3 dB up or down, are generally not perceptible.

[2] The pascal is a measure of pressure in the metric system. In Imperial units, they are themselves very small: one pascal is only 145 millionths of a pound per square inch (psi). The sound pressure at the threshold of audibility is only 3 one-billionths of one psi: at the threshold of pain, it is about 3 one-thousandths of one psi.

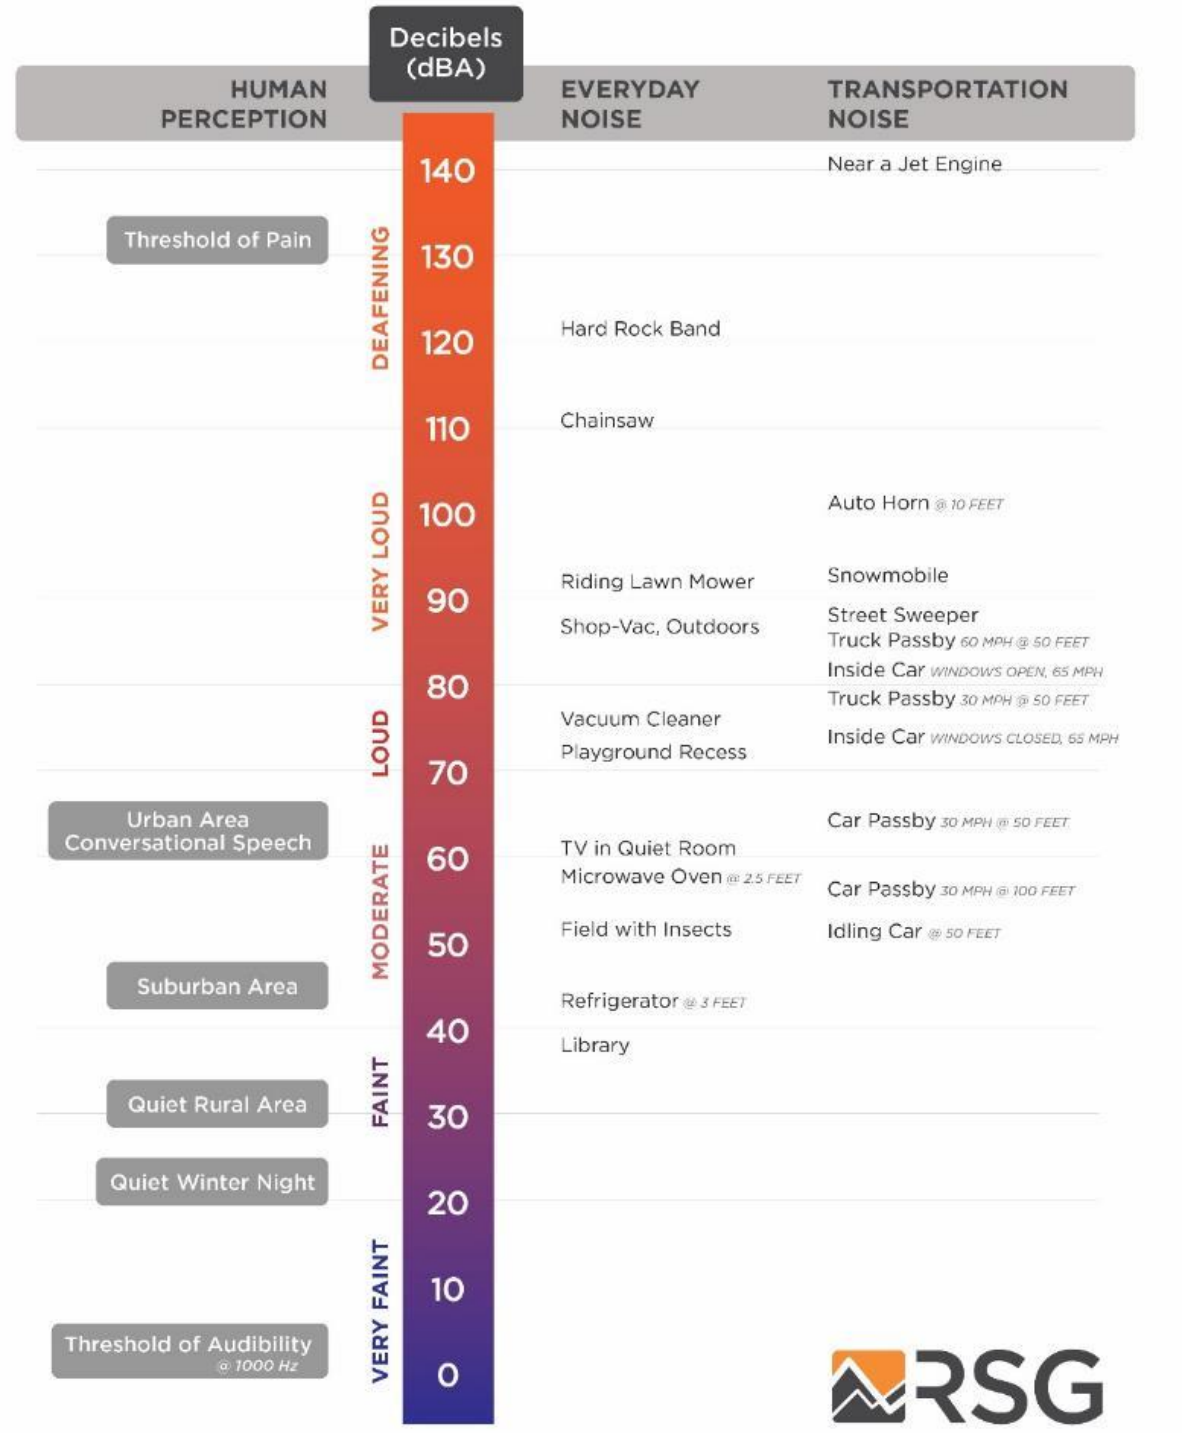

FIGURE 13: A SCALE OF SOUND PRESSURE LEVELS FOR TYPICAL SOUND SOURCES

Frequency Spectrum of Sound

The “frequency” of a sound is the rate at which it fluctuates in time, expressed in Hertz (Hz), or cycles per second. Very few sounds occur at only one frequency: most sound contains energy

at many different frequencies, and it can be broken down into different frequency divisions, or bands. These bands are similar to musical pitches, from low tones to high tones. The most common division is the standard octave band. An octave is the range of frequencies whose upper frequency limit is twice its lower frequency limit, exactly like an octave in music. An octave band is identified by its center frequency: each successive band's center frequency is twice as high (one octave) as the previous band. For example, the 500 Hz octave band includes all sound whose frequencies range between 354 Hz (Hertz, or cycles per second) and 707 Hz. The next band is centered at 1,000 Hz with a range between 707 Hz and 1,414 Hz. The range of human hearing is divided into 10 standard octave bands: 31.5 Hz, 63 Hz, 125 Hz, 250 Hz, 500 Hz, 1,000 Hz, 2,000 Hz, 4,000 Hz, 8,000 Hz, and 16,000 Hz. For analyses that require finer frequency detail, each octave-band can be subdivided. A commonly-used subdivision creates three smaller bands within each octave band, or so-called 1/3-octave bands.

Human Response to Frequency: Weighting of Sound Levels

The human ear is not equally sensitive to sounds of all frequencies. Sounds at some frequencies seem louder than others, despite having the same decibel level as measured by a sound level meter. In particular, human hearing is much more sensitive to medium pitches (from about 500 Hz to about 4,000 Hz) than to very low or very high pitches. For example, a tone measuring 80 dB at 500 Hz (a medium pitch) sounds quite a bit louder than a tone measuring 80 dB at 60 Hz (a very low pitch). The frequency response of normal human hearing ranges from 20 Hz to 20,000 Hz. Below 20 Hz, sound pressure fluctuations are not "heard", but sometimes can be "felt". This is known as "infrasound". Likewise, above 20,000 Hz, sound can no longer be heard by humans; this is known as "ultrasound". As humans age, they tend to lose the ability to hear higher frequencies first; many adults do not hear very well above about 16,000 Hz. Most natural and man-made sound occurs in the range from about 40 Hz to about 4,000 Hz. Some insects and birdsongs reach to about 8,000 Hz.

To adjust measured sound pressure levels so that they mimic human hearing response, sound level meters apply filters, known as "frequency weightings", to the signals. There are several defined weighting scales, including "A", "B", "C", "D", "G", and "Z". The most common weighting scale used in environmental noise analysis and regulation is A-weighting. This weighting represents the sensitivity of the human ear to sounds of low to moderate level. It attenuates sounds with frequencies below 1000 Hz and above 4000 Hz; it amplifies very slightly sounds between 1000 Hz and 4000 Hz, where the human ear is particularly sensitive. The C-weighting scale is sometimes used to describe louder sounds. The B- and D- scales are seldom used. All of these frequency weighting scales are normalized to the average human hearing response at 1000 Hz: at this frequency, the filters neither attenuate nor amplify. G-weighting is a standardized weighting used to evaluate infrasound.

When a reported sound level has been filtered using a frequency weighting, the letter is appended to "dB". For example, sound with A-weighting is usually denoted "dBA". When no filtering is applied, the level is denoted "dB" or "dBZ". The letter is also appended as a subscript to the level indicator "L", for example "L_A" for A-weighted levels.

Time Response of Sound Level Meters

Because sound levels can vary greatly from one moment to the next, the time over which sound is measured can influence the value of the levels reported. Often, sound is measured in real time, as it fluctuates. In this case, acousticians apply a so-called “time response” to the sound level meter, and this time response is often part of regulations for measuring sound. If the sound level is varying slowly, over a few seconds, “Slow” time response is applied, with a time constant of one second. If the sound level is varying quickly (for example, if brief events are mixed into the overall sound), “Fast” time response can be applied, with a time constant of one-eighth of a second.[3] The time response setting for a sound level measurement is indicated with the subscript “S” for Slow and “F” for Fast: L_S or L_F. A sound level meter set to Fast time response will indicate higher sound levels than one set to Slow time response when brief events are mixed into the overall sound, because it can respond more quickly.

In some cases, the maximum sound level that can be generated by a source is of concern. Likewise, the minimum sound level occurring during a monitoring period may be required. To measure these, the sound level meter can be set to capture and hold the highest and lowest levels measured during a given monitoring period. This is represented by the subscript “max”, denoted as “L_{max}”. One can define a “max” level with Fast response L_{Fmax} (1/8-second time constant), Slow time response L_{Smax} (1-second time constant), or Continuous Equivalent level over a specified time period L_{EQmax}.

Accounting for Changes in Sound Over Time

A sound level meter’s time response settings are useful for continuous monitoring. However, they are less useful in summarizing sound levels over longer periods. To do so, acousticians apply simple statistics to the measured sound levels, resulting in a set of defined types of sound level related to averages over time. An example is shown in Figure 14. The sound level at each instant of time is the grey trace going from left to right. Over the total time it was measured (1 hour in the figure), the sound energy spends certain fractions of time near various levels, ranging from the minimum (about 27 dB in the figure) to the maximum (about 65 dB in the figure). The simplest descriptor is the average sound level, known as the Equivalent Continuous Sound Level. Statistical levels are used to determine for what percentage of time the sound is louder than any given level. These levels are described in the following sections.

Equivalent Continuous Sound Level - Leq

One straightforward, common way of describing sound levels is in terms of the Continuous Equivalent Sound Level, or L_{EQ}. The L_{EQ} is the average sound pressure level over a defined period of time, such as one hour or one day. L_{EQ} is the most commonly used descriptor in noise standards and regulations. L_{EQ} is representative of the overall sound to which a person is exposed. Because of the logarithmic calculation of decibels, L_{EQ} tends to favor higher sound levels: loud and infrequent sources have a larger impact on the resulting average sound level than quieter but more frequent sounds. For example, in Figure 14, even though the sound levels

[3] There is a third time response defined by standards, the “Impulse” response. This response was defined to enable use of older, analog meters when measuring very brief sounds; it is no longer in common use.

spends most of the time near about 34 dBA, the L_{EQ} is 41 dBA, having been “inflated” by the maximum level of 65 dBA and other occasional spikes over the course of the hour.

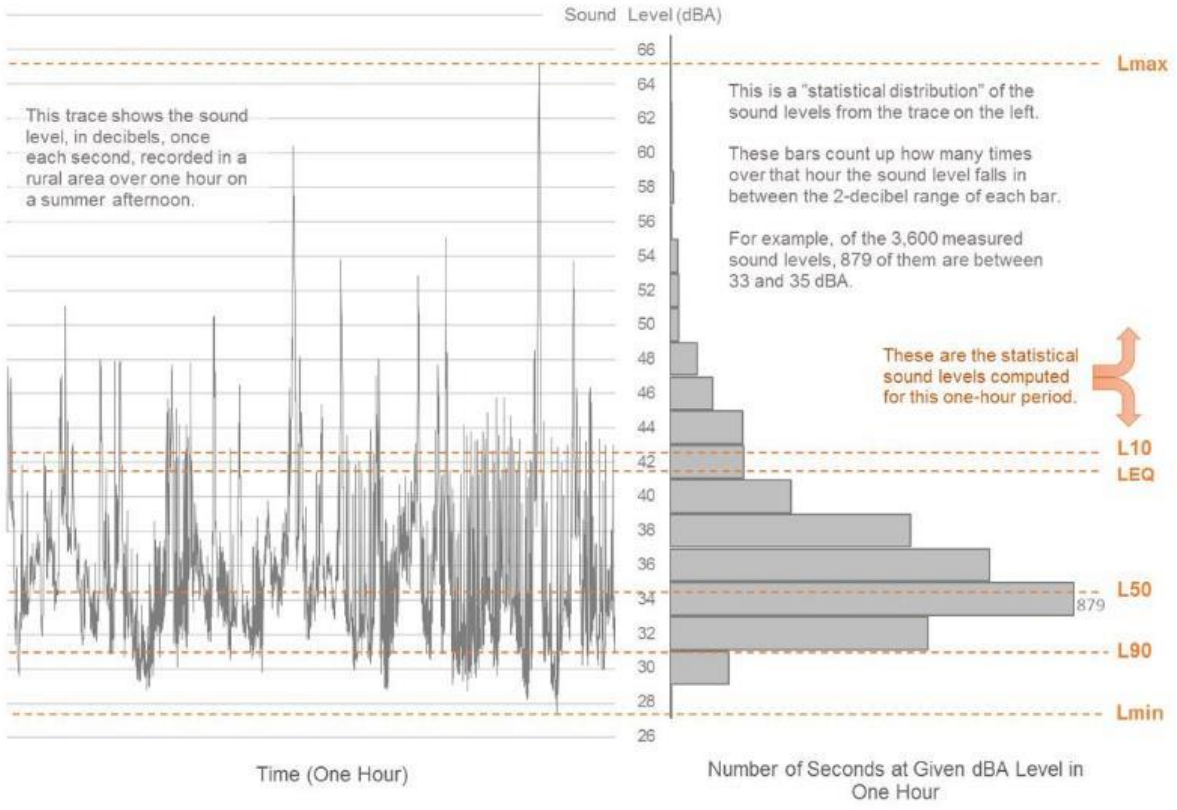

FIGURE 14: EXAMPLE OF DESCRIPTIVE TERMS OF SOUND MEASUREMENT OVER TIME

Percentile Sound Levels – Ln

Percentile sound levels describe the statistical distribution of sound levels over time. “L_N” is the level above which the sound spends “N” percent of the time. For example, L_{90} (sometimes called the “residual base level”) is the sound level exceeded 90% of the time: the sound is louder than L_{90} most of the time. L_{10} is the sound level that is exceeded only 10% of the time. (the “median level”) is exceeded 50% of the time: half of the time the sound is louder than , and half the time it is quieter than . Note that (median) and L_{EQ} (mean) are not always the same, for reasons described in the previous section.

L_{90} is often a good representation of the “ambient sound” in an area. This is the sound that persists for longer periods, and below which the overall sound level seldom falls. It tends to filter out other short-term environmental sounds that aren’t part of the source being investigated. L_{10} represents the higher, but less frequent, sound levels. These could include such events as barking dogs, vehicles driving by and aircraft flying overhead, gusts of wind, and work operations. L_{90} represents the background sound that is present when these event sounds are excluded.

Note that if one sound source is very constant and dominates the soundscape in an area, all of the descriptive sound levels mentioned here tend toward the same value. It is when the sound is varying widely from one moment to the next that the statistical descriptors are useful.

APPENDIX B. WIND TURBINE ACOUSTICS

Sources of Sound Generation by Wind Turbines

Wind turbines generate two principal types of noise: aerodynamic noise, produced from the flow of air around the blades, and mechanical noise, produced from mechanical and electrical components within the nacelle.

Aerodynamic noise is the primary source of noise associated with wind turbines. These acoustic emissions can be either tonal or broad band. Tonal noise occurs at discrete frequencies, whereas broadband noise is distributed with little peaking across the frequency spectrum.

While unusual, tonal noise can also originate from unstable air flows over holes, slits, or blunt trailing edges on blades. Most modern wind turbines have upwind rotors designed to prevent blade impulsive noise. Therefore, the majority of audible aerodynamic noise from wind turbines is broadband at the middle frequencies, roughly between 200 Hz and 1,000 Hz.

Wind turbines emit aerodynamic broadband noise as the spinning blades interact with atmospheric turbulence and as air flows along their surfaces. This produces a characteristic "whooshing" sound through several mechanisms (Figure 15):

- Inflow turbulence noise occurs when the rotor blades encounter atmospheric turbulence as they pass through the air. Uneven pressure on a rotor blade causes variations in the local angle of attack, which affects the lift and drag forces, causing aerodynamic loading fluctuations. This generates noise that varies across a wide range of frequencies but is most significant at frequencies below 500 Hz.
- Trailing edge noise is produced as boundary-layer turbulence as the air passes into the wake, or trailing edge, of the blade. This noise is distributed across a wide frequency range but is most notable at high frequencies between 700 Hz and 2 kHz.
- Tip vortex noise occurs when tip turbulence interacts with the surface of the blade tip. While this is audible near the turbine, it tends to be a small component of the overall noise further away.
- Stall or separation noise occurs due to the interaction of turbulence with the blade surface.

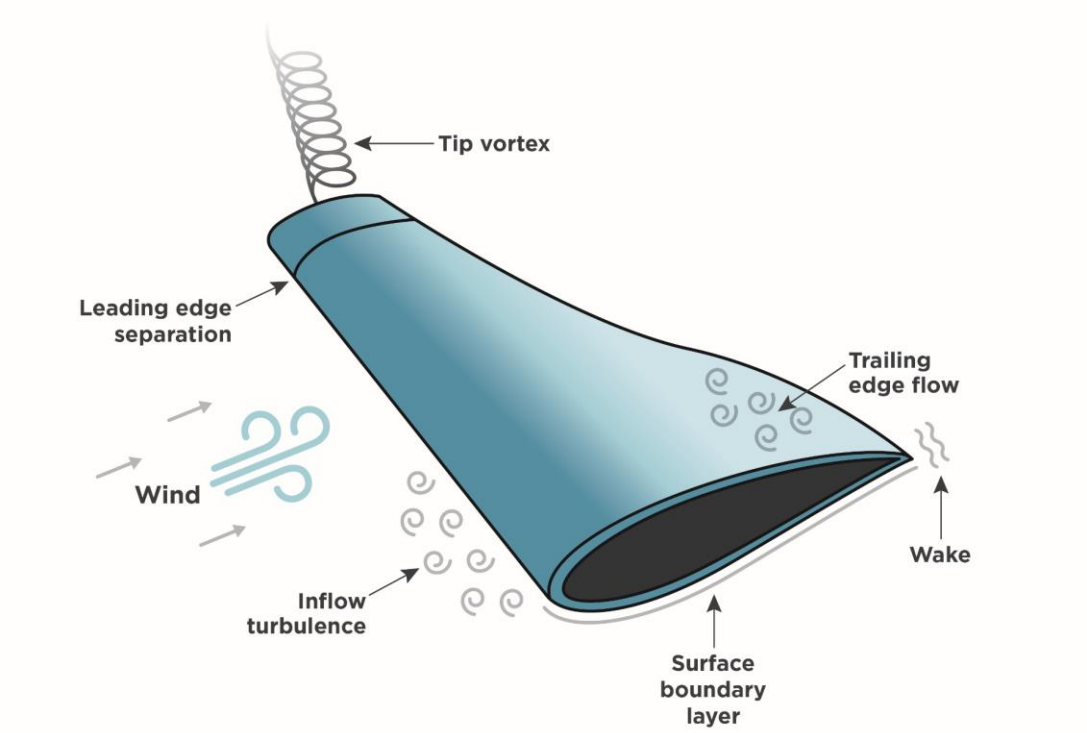

FIGURE 15: AIRFLOW AROUND A ROTOR BLADE

Mechanical sound from machinery inside the nacelle tends to be tonal in nature but can also have a broadband component. Potential sources of mechanical noise include the gearbox, generator, yaw drives, cooling fans, and auxiliary equipment. These components are housed within the nacelle, whose surfaces, if untreated, radiate the resulting noise. However modern wind turbines have nacelles that are designed to reduce internal noise, and rarely is the mechanical noise a significant portion of the total noise from a wind turbine.

Amplitude Modulation

Amplitude modulation (AM) is a fluctuation in sound level that occurs at the blade passage frequency. No consistent definition exists for how much of a sound level fluctuation is necessary for blade swish to be considered AM, however sound level fluctuations in A-weighted sound level can range up to 10 dB. Fluctuations in individual 1/3 octave bands are typically more and can exceed 15 dB. Fluctuations in individual 1/3 octave bands can sometimes synchronize and desynchronize over periods, leading to increases and decreases in magnitude of the A-weighted fluctuations. Similarly, in wind farms with multiple turbines, fluctuations can synchronize and desynchronize, leading to variations in AM depth.[4] Most amplitude modulation is in the mid frequencies and most overall A-weighted AM is less than 4.5 dB in depth.[5]

Many confirmed and hypothesized causes of AM exist, including: blade passage in front of the tower, blade tip sound emission directivity, wind shear, inflow turbulence, and turbine blade yaw

[4] McCunney, Robert, et al. “Wind Turbines and Health: A Critical Review of the Scientific Literature.” *Journal of Occupational and Environmental Medicine.* 56(11) November 2014: pp. e108-e130.

error. It has recently been noted that although wind shear can contribute to the extent of AM, wind shear does not contribute to the existence of AM in and of itself. Instead, there needs to be detachment of airflow from the blades for wind shear to contribute to AM.[6] While factors like the blade passing in front of the tower are intrinsic to wind turbine design, other factors vary with turbine design, local meteorology, topography, and turbine layout. Mountainous areas, for example, are more likely to have turbulent airflow, less likely to have high wind shear, and less likely to have turbine layouts that allow for blade passage synchronization for multiple turbines. AM extent varies with the relative location of a receiver to the turbine. AM is usually experienced most when the receiver is between 45 and 60 degrees from the downwind or upwind position and is experienced least directly with the receiver directly upwind or downwind of the turbines.

Meteorology

Meteorological conditions can significantly affect sound propagation. The two most important conditions to consider are wind shear and temperature lapse. Wind shear is the difference in wind speeds by elevation and temperature lapse rate is the temperature gradient by elevation. In conditions with high wind shear (large wind speed gradient), sound levels upwind from the source tend to decrease and sound levels downwind tend to increase due to the refraction, or bending, of the sound (Figure 16).

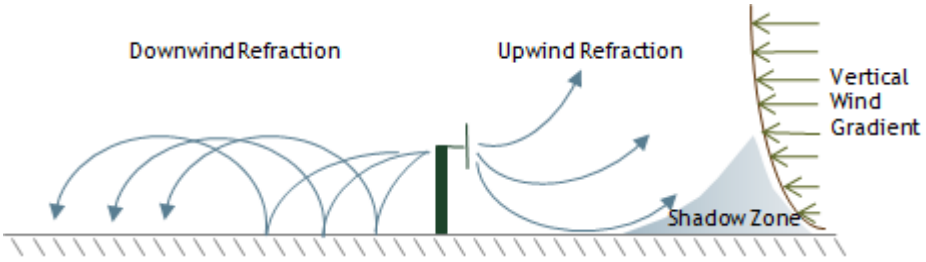

FIGURE 16: SCHEMATIC OF THE REFRACTION OF SOUND DUE TO VERTICAL WIND GRADIENT (WIND SHEAR)

With temperature lapse, when ground surface temperatures are higher than those aloft, sound will tend to refract upwards, leading to lower sound levels near the ground. The opposite is true when ground temperatures are lower than those aloft (an inversion condition).

High winds and high solar radiation can create turbulence which tends to break up and dissipate sound energy. Highly stable atmospheres, which tend to occur on clear nights with low ground-level wind speeds, tend to minimize atmospheric turbulence and are generally more favorable to downwind propagation.

In general terms, sound propagates along the ground best under stable conditions with a strong temperature inversion. This tends to occur during the night and is characterized by low ground-level winds. As a result, worst-case conditions for wind turbines tend to occur downwind under moderate nighttime temperature inversions. Therefore, this is the default condition for modeling wind turbine sound.

[6] "Wind Turbine Amplitude Modulation: Research to Improve Understanding as to its Cause and Effect." *RenewableUK.* December 2013.

Masking

As mentioned above, sound levels from wind turbines are a function of wind speed. Background sound is also a function of wind speed, i.e., the stronger the winds, the louder the resulting background sound. This effect is amplified in areas covered by trees and other vegetation.

The sound from a wind turbine can often be masked by wind noise at downwind receivers because the frequency spectrum from wind is similar to the frequency spectrum from a wind turbine. Figure 17 compares the shape of the sound spectrum measured during a 5 m/s wind event to that of the GE 2.8-127 LNTE wind turbine. As shown, the shapes of the spectra are similar at lower frequencies. At higher frequencies, the sounds from the masking wind noise are higher than the wind turbine. As a result, the masking of turbine noise occurs at higher wind speeds for some meteorological conditions. Masking will occur most, when ground wind speeds are relatively high, creating wind-caused noise such as wind blowing through the trees and interaction of wind with structures.

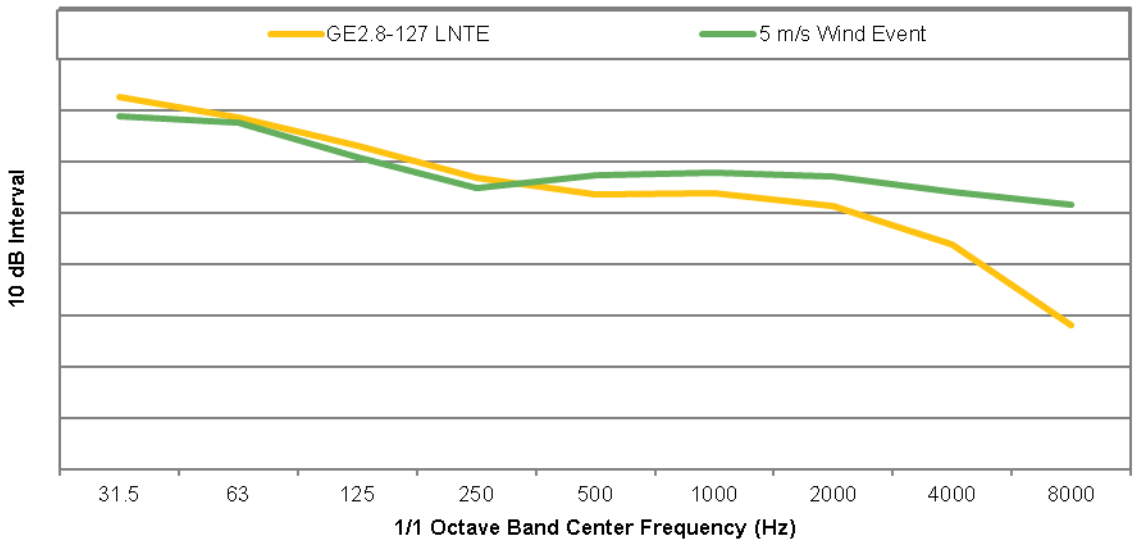

FIGURE 17: COMPARISON OF NORMALIZED FREQUENCY SPECTRA MEASURED FROM A 5 M/S WIND EVENT AND THE SOUND POWER SPECTRA FROM THE GE 2.8-127 LNTE[7]

It is important to note that while winds may be blowing at turbine height, there may be little to no wind at ground level. This is especially true during strong wind gradients (high wind shear), which mostly occur at night. This can also occur on the leeward side of ridges where the ridge blocks the wind.

[7] The purpose of this Figure is to show the shapes to two spectra relative to one another and not the actual sound level of the two sources of sound. The level of each source was normalized independently.

About the Author

Dr. David G. Loomis is Professor of Economics at Illinois State University and Co-Founder of the Center for Renewable Energy. He has over 10 years of experience in the renewable energy field and has performed economic analyses at the county, region, state and national levels for utility-scale wind and solar generation. He has served as a consultant for Apex Clean Energy, Clean Line Energy Partners, EDF Renewables, E.ON Climate and Renewables, Geronimo Energy, Invenergy, J-Power, the National Renewable Energy Laboratories, Ranger Power, State of Illinois, Tradewind, and others. He has testified on the economic impacts of energy projects before the Illinois Commerce Commission, Missouri Public Service Commission, Illinois Senate Energy and Environment Committee and numerous county boards. Dr. Loomis is a widely recognized expert and has been quoted in the Wall Street Journal, Forbes Magazine, Associated Press, and Chicago Tribune as well as appearing on CNN.

Dr. Loomis has published over 25 peer-reviewed articles in leading energy policy and economics journals. He has raised and managed over $7 million in grants and contracts from government, corporate and foundation sources. He received the 2011 Department of Energy's Midwestern Regional Wind Advocacy Award and the 2006 Best Wind Working Group Award. Dr. Loomis received his Ph.D. in economics from Temple University in 1995.

Executive Summary

Apex Clean Energy is developing the Lincoln Land Wind Project in Morgan County, Illinois. The purpose of this report is to evaluate the economic impact of this Project on Morgan County and the State of Illinois. The basis of this analysis is to study the direct, indirect and induced impacts on job creation, wages, and total economic output.

The Project consists of an estimated 120 wind turbines and the associated access roads, transmission and communication equipment, storage areas, and control facilities (the "Project"). For purposes of this report, a total name plate capacity of 300 megawatts ("MW") in Morgan County was assumed. The Project represents an investment of over $400 million in Morgan County. The total development is anticipated to result in the following:

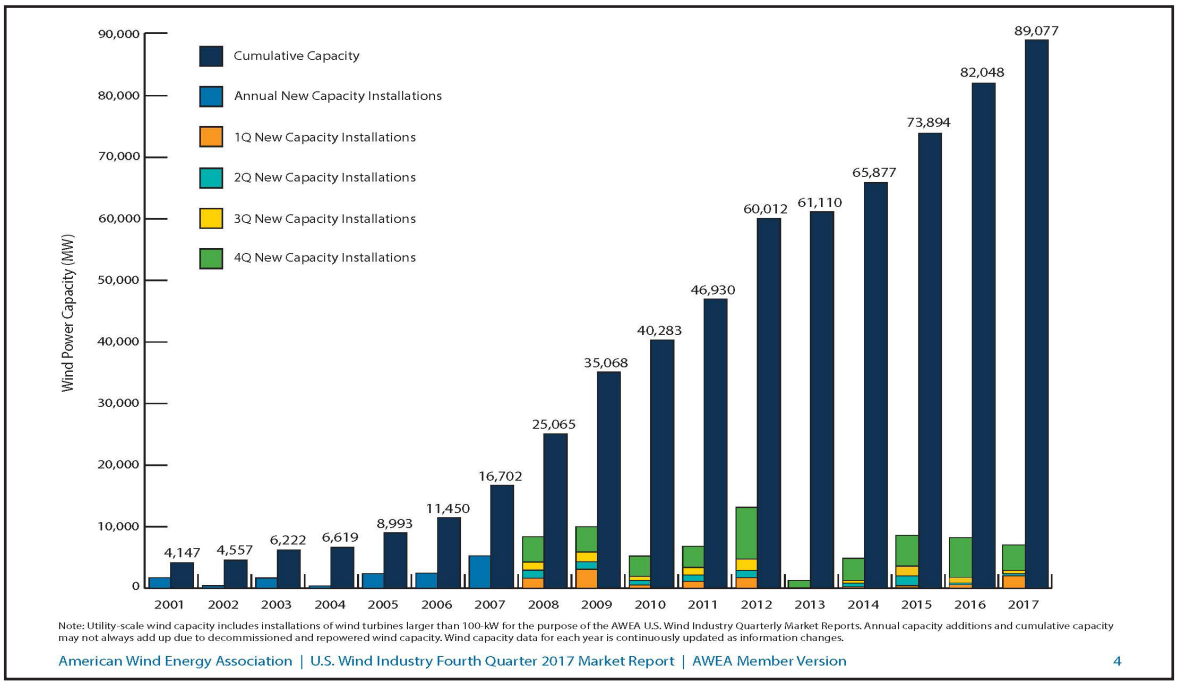
Jobs
- 394 new jobs during construction for Morgan County
- 1,235 new jobs during construction for the State of Illinois
- 39 new long-term jobs for Morgan County
- 55 new long-term jobs for the State of Illinois

Earnings
- Over $19.3 million in new earnings during construction for Morgan County
- Over $82.7 million in new earnings during construction for the State of Illinois
- Over $1.6 million in new long-term earnings for Morgan County annually
- Over $3.2 million in new long-term earnings for the State of Illinois annually

Output - the value of goods and services added to the state or local economy. It is an equivalent measure to the Gross Domestic Product
- Almost $48.9 million in new output during construction for Morgan County
- Almost $226.7 million in new output during construction for the State of Illinois
- Over $8.1 million in new long-term output for Morgan County annually
- Over $12.2 million for the State of Illinois in new long-term output annually

Property Taxes
- Almost $43.8 million in total school district revenue over the life of the Project
- Over $5.5 million in total road district property taxes over the life of the Project
- Almost $9.8 million in total county property taxes for Morgan County over the life of the Project
- Over $65.6 million in property taxes in total for all taxing districts over the life of the Project

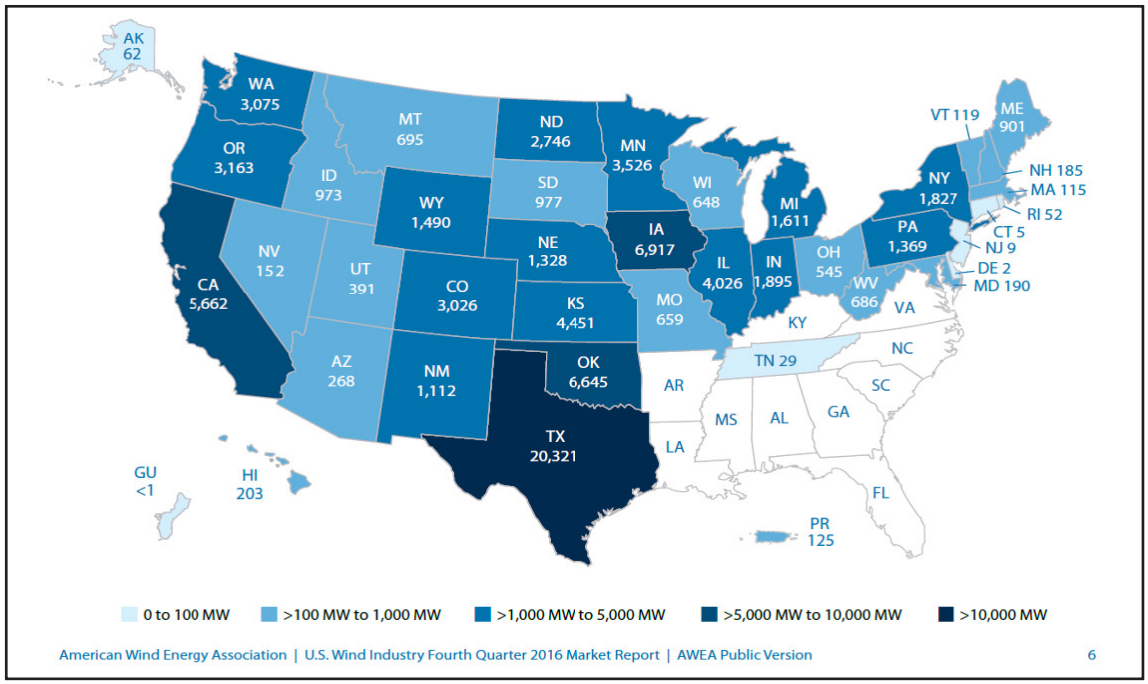
II. United States Wind Industry Growth and Economic Development



a. United States Wind Industry Growth

The United States wind industry grew at a rapid but uneven pace from 2006-2017. In 2012, the U.S. set a new record of 13,131 MW far surpassing the previous annual peak just over 10,000 MW of wind power installed in 2009 (American Wind Energy Association, 2018). Due to the uncertainty surrounding wind energy policy, the industry only installed 1,087 MW in 2013. The industry rebounded with steady growth of 8,115 MW installed in 2015; 8,203 MW in 2016; and 7,017 MW in 2017 (AWEA, 2018).

The total amount of wind capacity in the U.S. by the end of 2017 was 89,077 MW, which is enough to power the equivalent of 26 million homes (AWEA, 2018). China is the global leader with 168.7 gigawatts ("GW") of installed capacity, with Germany in third place with 50.0 GW of installed capacity (2016 figures with the United States in second place) (GWEC, 2017). Figure 1 shows the growth in installed annual capacity and cumulative capacity in the U.S. and Figure 2 shows the state-by-state breakdown of installed capacity.



Several factors have spurred the continued growth of wind energy in recent years. First, new technology and rigorous competition among turbine manufacturers lowered the cost of wind turbines. Second, larger capacity wind turbines and higher hub heights produced more output and lowered the cost of wind energy production. Third, several large corporate buyers increased the demand for wind energy beyond the traditional electric utility market. Finally, the current phase-out of the Production Tax Credit (which provides a per-kWh tax credit) incentivized wind developers to develop projects as quickly as possible to receive the maximum tax credit.

b. Illinois Wind Industry Growth

Illinois' wind power capacity has grown from 50 MW in 2003 to 4,332 MW in 2017 (AWEA, 2018). As of December 2017, Illinois ranked 6th in the United States in existing wind-powered generating capacity and ranked 16th in the United States in potential capacity (AWEA, 2010b; AWEA, 2018). Table 1 has a list of the operational wind farms in Illinois. Illinois has 29 wind farms greater than 50 MW covering parts of 19 different counties.

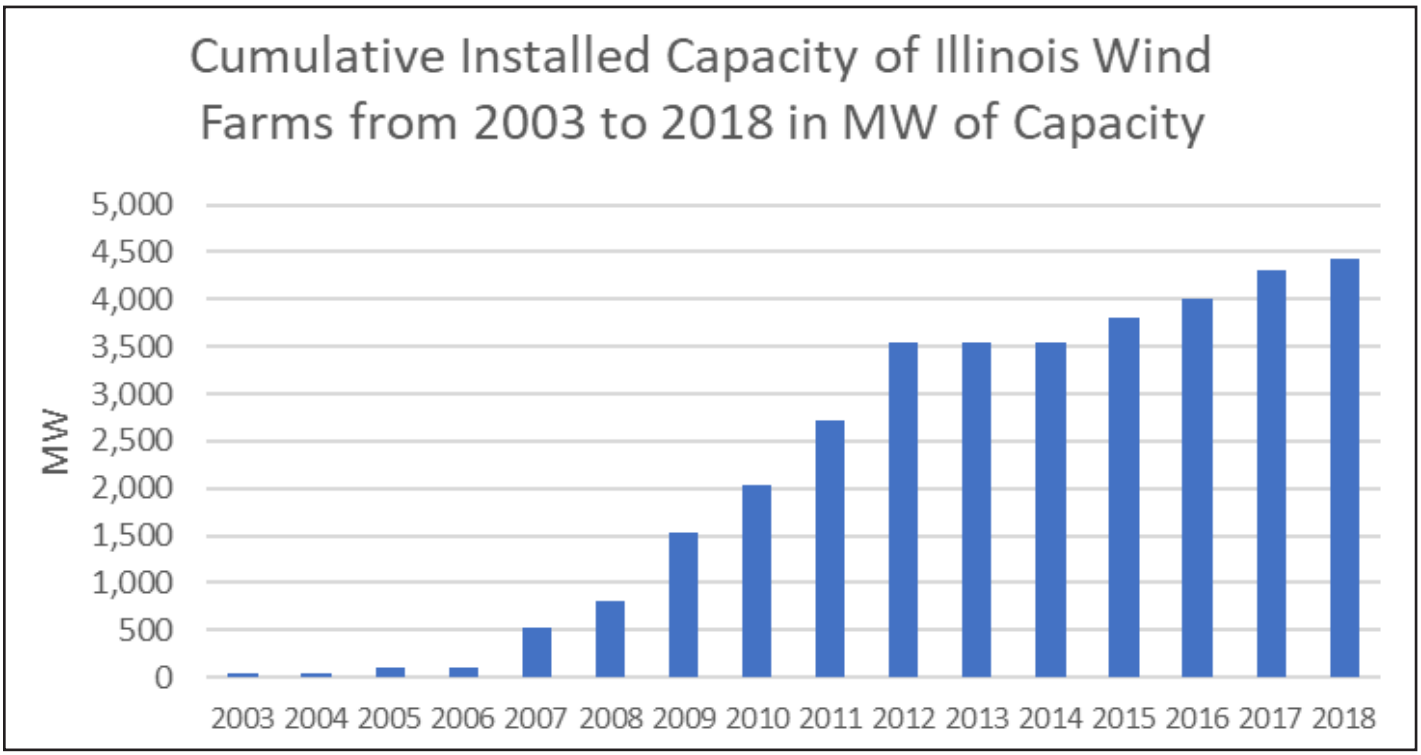

Figure 3 shows the cumulative installed wind energy capacity from 2003 to present. No wind farms were built completed in 2013 and 2014. Three wind farms are currently under construction: HillTopper Wind in Logan County (185 MW); Mendota Hills Repowering in Lee County (76 MW); and Walnut Ridge Wind Project in Bureau County (210 MW). In total, over 450 MW of wind capacity will be added once these projects are completed.

Table 1. — Illinois Wind Farm Projects over 50 MW

Wind Farm	Location (County)	Capacity (MW)

c. Economic Benefits of Wind Farms

Wind farms create numerous economic benefits that continue to last for decades. Wind farms create job opportunities in the local area during both the short-term construction phase and the long-term operational phase. Short-term construction jobs include both workers at the wind farm site and jobs created along the supply chain. Long-term operational jobs include wind turbine technicians, supervisors and supply chain jobs.

Wind developers typically lease the land for the turbines from local landowners without materially affecting ongoing agricultural uses. Only a small portion of the total Project area is used for the turbines, access roads, feeder lines and substations. Lease payments made to landowners provide a reliable source of long-term income to offset the fluctuating prices received from crops or the impact of weather events on production. Landowners then have additional funds to make purchases in the local economy and elsewhere.

Wind projects enhance the equalized assessed value of property within the county. Wind farms strengthen the local tax base helping to improve county services, schools, police and fire departments and infrastructure improvements, such as public roads. For a more detailed explanation of the property tax benefits of wind farms see Section VII.

Numerous studies have quantified the economic benefits across the United States. The National Renewable Energy Laboratory has produced economic impact reports for the State of Arizona (NREL, 2008a), State of Idaho (NREL, 2008b), State of Indiana (NREL, 2014), State of Iowa (NREL, 2013), State of Maine (NREL, 2008c), State of Montana (NREL, 2008d), State of New Mexico (NREL, 2008e), State of Nevada (NREL, 2008f), State of Pennsylvania (NREL, 2008g), State of South Dakota (NREL, 2008h), State of Utah (NREL 2008i), State of West Virginia (NREL, 2008j), State of Wisconsin (NREL, 2008k), and the State of North Carolina (NREL, 2009).

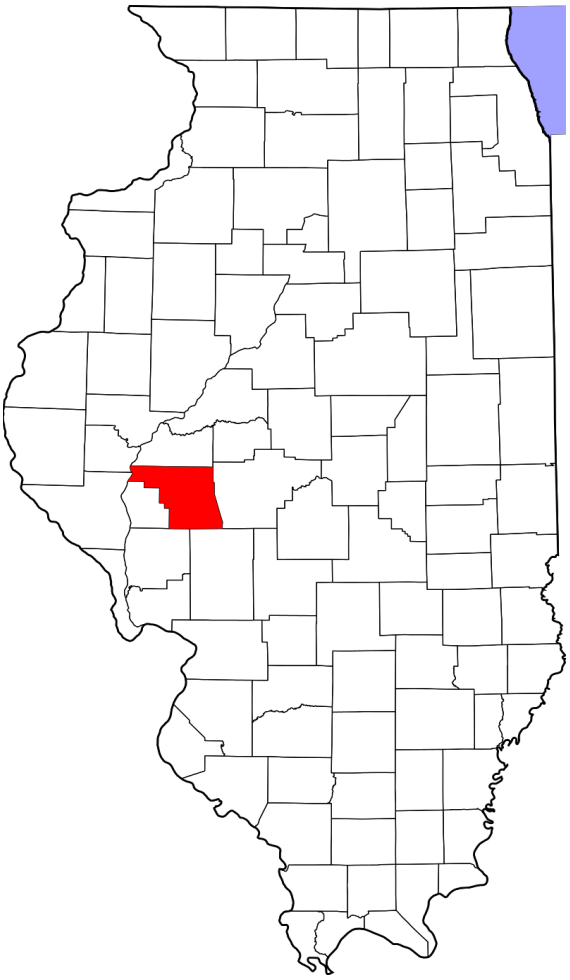
More locally, the Center for Renewable Energy at Illinois State University recently released a report examining the economic impact of Illinois wind farms and the economic impact of the related wind turbine supply chain in Illinois (see https://renewableenergy.illinoisstate.edu/wind/pubs.php). According to the Economic Impact: Wind Energy Development in Illinois (June 2016), "the 25 largest wind farms in Illinois:

- Created approximately 20,173 full-time equivalent jobs during construction periods
- Support approximately 869 permanent jobs in rural Illinois areas
- Support local economies by generating $30.4 million in annual property taxes
- Generate $13.86 million annually in extra income for Illinois landowners who lease their land to the wind farm developer
- Will generate a total economic benefit of $6.4 billion over the life of the projects."

III. Wind Farm Project Description and Location

a. Lincoln Land Wind Project Description

Lincoln Land Wind, LLC ("Lincoln Land" or the "Project"), is a 300 MW mid-stage-development wind project located in Morgan County, Illinois, near the City of Jacksonville, home to Illinois College and MacMurray College. The Project is expected to enter operation by Q4 2020.



Project highlights include the following:

- The Lincoln Land project boasts an excellent wind resource and will contribute substantially to the clean energy future of Illinois given the wind resources available at the site and the use of the latest wind turbine technology.
- In structuring this wind energy project, we have relied upon Apex's extensive experience developing and constructing similarly sized projects.
- The project will utilize 83 to 120 modern wind turbines.
- The turbine layout will encompass approximately 25,000 acres of land.
- The Project has been engineered and planned to qualify for the federal production tax credit ("PTC") under current law and IRS guidance.
- The Project has strong community support.

b. Morgan County, Illinois

Morgan County is located in the west-central part of Illinois (see Figure 4). It has a total area of 572 square miles and the U.S. Census estimates that the 2010 population was 35,547 with 15,515 housing units. The County has a population density of 62.5 (persons per square mile) compared to 231.1 for the State of Illinois. Median household income in the county was $44,645. As shown in Table 2, the largest industry is "Health care and social assistance" followed by "Manufacturing," "Retail trade" and "Accomodation and food services."

Table 2 — Non-Governmental Employment by Industry in Morgan County

Industry	Number	Percent
Health care and social assistance	2567	19.6%
Manufacturing	2017	15.4%
Retail trade	1874	14.3%
Accommodation and food services	1225	9.4%
Finance and insurance	1022	7.8%
Educational services	982	7.5%
Professional, scientific, and technical services	642	4.9%
Transportation and warehousing	488	3.7%
Other services (except public administration)	445	3.4%
Wholesale trade	419	3.2%
Construction	373	2.9%
Administrative and support and waste management and remediation services	323	2.5%
Arts, entertainment, and recreation	242	1.9%
Information	187	1.4%
Real estate and rental and leasing	105	0.8%
Management of companies and enterprises	59	0.5%
Utilities	20-99	0.2%-0.8%
Industries not classified	0-19	0.0%-0.1%

Source: U. S. Census Bureau, 2016 County Business Patterns

These data for Table 2 come from the U.S. Census' County Business Patterns. County Business Patterns, "covers most of the country's economic activity. The series excludes data on self-employed individuals, employees of private households, railroad employees, agricultural production employees, and most government employees." Thus, the employment in Agriculture listed in Table 2 only counts individuals employed by a company. To get a more accurate picture of the agriculture sector in the county, the 2012 Census of Agriculture lists 470 principal operators with farming as their primary occupation and another 287 principal operators having another occupation as their primary occupation. These principal operators would put the agriculture sector at around 6% of the county's private workforce.

IV. Methodology

NREL: National Renewable Energy Laboratory

JEDI: Jobs and Economic Development Impacts

IMPLAN: IMpact Analysis for PLANning

The economic analysis of wind power development presented here utilizes the National Renewable Energy Laboratory's (NREL's) latest Jobs and Economic Development Impacts (JEDI) Wind Energy Model (W6-29-18). NREL is the U.S. Department of Energy's primary national laboratory for renewable energy and energy efficiency research and development. The JEDI Wind Energy Model is an input-output model that measures the spending patterns and location-specific economic structures that reflect expenditures supporting varying levels of employment, income, and output. Essentially, JEDI is an input-output model, which takes into account the fact that the output of one industry can be used as an input for another. For example, when a wind farm developer purchases turbines to build a wind farm, those wind turbines are made of components such as fiberglass, aluminum, steel, copper, etc. Therefore, purchases of wind turbines impact the demand for these components. In addition, when a wind farm developer purchases a wind turbine from a manufacturing facility, the manufacturer uses some of that money to pay employees, and then the employees spend that money to purchase goods and services within their community. In essence, JEDI reveals how purchases of wind project materials not only benefit turbine manufacturers but also the local industries that supply the concrete, rebar, and other materials (Reategui et al., 2009). The JEDI model uses construction cost data, operating cost data, and data relating to the percentage of goods and services acquired in the state to calculate jobs, earnings, and economic activities that are associated with this information. The results are broken down into the construction period and the operation period of the wind project. Within each period, impacts are further divided into direct, turbine and supply chain (indirect), and induced impacts.

The JEDI Model was developed in 2002 to demonstrate the economic benefits associated with developing wind farms in the United States. The model was developed by Marshall Goldberg of MRG & Associates, under contract with the National Renewable Energy Laboratory. The JEDI model utilizes state specific industry multipliers obtained from IMPLAN (IMpact Analysis for PLANning). IMPLAN software and data are managed and updated by the Minnesota IMPLAN Group, Inc., using data collected at federal, state, and local levels. The JEDI model considers 14 aggregated industries that are impacted by the construction and operation of a wind farm: agriculture, construction, electrical equipment, fabricated metals, finance/insurance/ real estate, government, machinery, mining, other manufacturing, other services, professional service, retail trade, transportation/communication/ public utilities, and wholesale trade (Reategui et al., 2009). This study does not analyze net jobs. It analyzes the gross jobs that the new wind farm development supports.

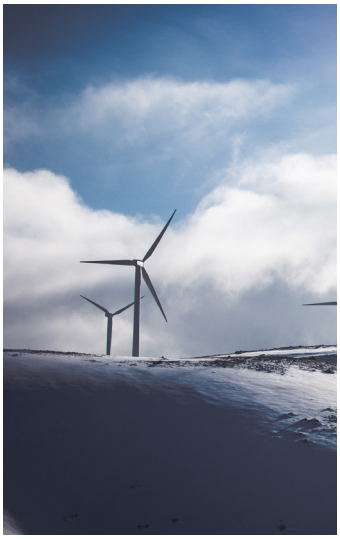
Direct impacts during the construction period refer to the changes that occur in the onsite construction industries in which the direct final demand (i.e., spending on construction labor and services) change is made. Final demands are goods and services purchased for their ultimate use by the end user. Onsite construction-related services include engineering, design, and other professional services.

Direct impacts during operating years refer to the final demand changes that occur in the onsite spending for wind farm workers. Direct jobs consist primarily of onsite construction and project development labor.

The initial spending on the construction and operation of the wind farm creates a second layer of impacts, referred to as "turbine and supply chain impacts" or "indirect impacts."

Indirect impacts during the construction period consist of the changes in inter-industry purchases resulting from the direct final demand changes, and include construction spending on materials and wind farm equipment and other purchases of goods and offsite services. Essentially, these impacts result from "spending related to project development and on-site labor such as equipment costs (turbines, blades, towers, transportation), manufacturing of components and supply chain inputs, materials (transformer, electrical, HV line extension, HV substation and interconnection materials), and the supply chain of inputs required to produce these materials" (JEDI Support Team, 2009, 2). Concrete that is used in turbine foundations increases the demand for gravel, sand, and cement. As a result of the expenditure for concrete there is increased economic activity at quarries and cement factories and these changes are indirect impacts. The accountant for the construction firm and the banker who finances the contractor are both considered indirect impacts. All supply chain component impacts/manufacturing-related activities are included under indirect impacts; therefore, the late stage turbine assembly process, which includes gearbox assembly, blade production, and steel rolling are all included under the construction period indirect impacts category.

Indirect impacts during operating years refer to the changes in inter-industry purchases resulting from the direct final demand changes. Essentially, these impacts result from "expenditures related to on-site labor, materials, and services needed to operate the wind farms (e.g., vehicles, site maintenance, fees, permits, licenses, utilities, insurance, fuel, tools and supplies, replacement parts/equipment); the supply chain of inputs required to produce these goods and services; and project revenues that flow to the local economy in the form of land lease revenue, property tax revenue, and revenue to equity investors" (JEDI Support Team, 2009, 3). All land lease payments and property taxes show up in the operating-years portion of the results because these payments do not support the day-to-day operations and maintenance of the wind farm but instead are more of a latent effect that results from the wind farm being present (Eric Lantz, February 25, 2009, e-mail message to Jennifer Hinman).



Induced impacts during construction refer to the changes that occur in household spending as household income increases or decreases due to the direct and indirect effects of final demand changes. Local spending by employees working directly or indirectly on the wind farm project who receive their paychecks and then spend money in the community is included. Additional local jobs and economic activity are supported by these purchases of goods and services. Thus, for example, the increased economic activity at quarries and cement factories results in increased revenues for the affected firms and raises individual incomes. Individuals employed by these companies then spend more money in the local economy, e.g., as workers receive income, they may decide to purchase more expensive clothes, or higher quality food along with other goods and services from local businesses. This increased economic activity may result from "construction workers who spend a portion of their income on lodging, groceries, clothing, medicine, a local movie theater, restaurant, or bowling alley;" or a "steel mill worker who provides the inputs for turbine production and spends his money in a similar fashion, thus supporting jobs and economic activities in different sectors of the economy" (JEDI Support Team, 2009, 2).

Induced impacts during operating years refer to the changes that occur in household spending as household income increases or decreases as a result of the direct and indirect effects from final demand changes. Some examples include a "wind farm technician who spends income from working at the wind farm on buying a car, a house, groceries, gasoline, or movie tickets;" or a "worker at a hardware store who provides spare parts and materials needed at the wind farm and who spends money in a similar fashion, thus supporting jobs and economic activities in different sectors of the economy" (JEDI Support Team, 2009, 3).

This methodology has been validated by a paper in the peer-reviewed economics literature. In the article, "Ex Post Analysis of Economics Impacts from Wind Power Development in U. S. Counties," the authors conduct an ex post econometric analysis of the county-level economic development impacts of wind power installations from 2000 through 2008. They find an aggregate increase in county-level personal income and employment of approximately $11,000 and 0.5 jobs per megawatt of wind power capacity during that time which is consistent with the JEDI results at the county level. (Brown, 2012)

V. Results

The results were derived from project cost estimates supplied by Apex Clean Energy. In addition, Apex helped estimate the percentages of project materials and labor that will be coming from within Morgan County and the State of Illinois.

Two separate JEDI models were run to show the economic impact of the Project. The first JEDI model used the 2016 Morgan County multipliers from IMPLAN. The second JEDI model used the 2016 State of Illinois multipliers from IMPLAN and the same Project costs. Because the multipliers and the local content percentage are different for the two models, the results are independent from one another. However, any local content coming from Morgan County is obviously coming from the State of Illinois as well. Similarly, the State of Illinois multipliers will generally be larger than Morgan County multipliers but some individual sectors of the economy could be stronger.

The output from these models is shown in Tables 3-5. Table 3 lists the total employment impact from the Project for Morgan County and the State of Illinois. Table 4 shows the impact on total earnings and Table 5 contains the impact on total output. The results are divided into one-time construction impacts and ongoing annually recurring operations impacts that are expected to last for the full life of the project which is estimated to be 25-40 years. Project Development and Onsite Labor Impacts correspond to direct impacts as defined in the methodology section. Turbine and Supply Chain Impacts are the indirect impacts during construction and Local Revenue and Supply Chain Impacts are indirect impacts during operations.

Table 3. — Total Employment Impact from the Lincoln Land Wind Project

	Morgan County	State of Illinois
Construction		
Project Development and Onsite Labor Impacts	81	143
Turbine and Supply Chain Impacts	256	748
Induced Impacts	57	344
New Local Jobs during Construction	394	1,235
Operations		
Onsite Labor Impacts	14	14
Local Revenue and Supply Chain Impacts	10	15
Induced Impacts	15	26
New Local Long Term Jobs	39	55

The results from the JEDI model show significant employment impacts from the Lincoln Land Wind project. Employment impacts can be broken down into several different components. Direct jobs created during the construction phase typically last anywhere from 6 months to over a year depending on the size of the project; however, the direct job numbers present in Table 3 from the JEDI model are based on a full-time equivalent (FTE) basis for a year. In other words, 1 job = 1 FTE = 2,080 hours worked in a year. A part time or temporary job would constitute only a fraction of a job according to the JEDI model. For example, the JEDI model results show 394 new jobs during construction in Morgan County, though the construction of the Project could actually involve hiring closer to 788 workers for 6 months.

As shown in Table 3, new local jobs created or retained during construction total 394 for Morgan County, and 1,235 for the State of Illinois. For Morgan County, the expected 394 local jobs represent roughly 3% of the current non-government employment in the County. New local long-term jobs created from the Project total 39 for Morgan County and 55 for the State of Illinois. Since 2007, Morgan County has lost 134 jobs on average each year in private employment so 39 additional jobs would help reserve that trend.

Direct jobs created during the operational phase last the life of the wind farm, typically 25-40 years. Direct construction jobs and operations and maintenance jobs both require highly-skilled workers in the fields of construction, management, and engineering. These well-paid professionals boost economic development in rural communities where new employment opportunities are welcome due to economic downturns (Reategui and Tegen, 2008).

Accordingly, it is important to not just look at the number of jobs but also the earnings that they produce. The earnings impacts from the Project are shown in Table 4 and are categorized by construction impacts and operations impacts. The new local earnings during construction total over $19.3 million for Morgan County and over $82.7 million for the State of Illinois. The new local long-term earnings total almost $1.7 million for Morgan County and over $3.2 million for the State of Illinois.

Table 4. — Total Earnings Impact from Lincoln Land Wind Project

	Morgan County	State of Illinois
Construction		
Project Development and Onsite Earnings Impacts	$5,516,173	$10,493,390
Turbine and Supply Chain Impacts	$11,728,989	$52,335,089
Induced Impacts	$2,142,396	$19,940,524
New Local Earnings during Construction	$19,387,558	$82,769,003
Operations		
Onsite Labor Impacts	$714,437	$714,437
Local Revenue and Supply Chain Impacts	$417,434	$1,003,853
Induced Impacts	$553,483	$1,508,253
New Local Long Term Earnings	$1,685,354	$3,226,543

Output refers to economic activity or the value of production in the state or local economy. Economic output includes the earnings reported in Table 4 but also measures other factors such as landowner payments, property taxes, and other economic activity that is not earnings and benefits from employment.

According to Table 5, the new local output during construction totals almost $48.9 million for Morgan County and almost $226.7 million for the State of Illinois. The new local long-term output totals over $8.1 million for Morgan County and over $12.2 million for the State of Illinois. For context, Morgan County's total output in 2016 was $1.475 billion according the IMPLAN, so this Project is estimated to add 3.3% to the County's output in the year it is built. Output grew by $36.4 million from 2015 to 2016 in Morgan County according to IMPLAN. If the wind farm were built in 2016, the County's output growth would rise from 2.5% per year to 3.0% per year.

Table 5. — Total Output Impact from Lincoln Land Wind Project

	Morgan County	State of Illinois
Construction		
Project Development and Onsite Jobs Impacts on Output	$6,310,797	$11,722,434
Turbine and Supply Chain Impacts	$35,331,767	$156,948,414
Induced Impacts	$7,252,299	$58,022,727
New Local Output during Construction	$48,894,863	$226,693,574
Operations (Annual)		
Onsite Labor Impacts	$714,437	$714,437
Local Revenue and Supply Chain Impacts	$5,535,267	$7,136,896
Induced Impacts	$1,874,000	$4,389,225
New Local Long Term Output	$8,123,704	$12,240,558

VI. Property Taxes

Wind power projects increase the property tax base of a county, creating a new revenue source for education and other local government services, such as fire protection, park districts, and road maintenance. According to state law (Public Act 095-0644), the fair cash value for a utility-scale wind turbine in Illinois is $360,000 per megawatt of capacity beginning in 2007 and is annually adjusted for inflation and depreciation. The inflation adjustment, also known as the Trending Factor, increases each year according to the Bureau of Labor Statistics' Consumer Price Index for all cities for all items. According to the Illinois Department of Revenue, "[t]he trending factor for assessment year 2018 is 1.22." (http://www.revenue.state.il.us/LocalGovernment/PropertyTax/WindEnergyDeviceValuation.pdf) Depreciation is allowed at 4% per year up to a maximum total depreciation of 70% of the trended real property cost basis (calculated by taking the fair cash value of the turbine and multiplying by the Trending Factor).

Tables 6-11 detail the tax implications of the Lincoln Land Wind Project. There are several important assumptions built into the analysis in these tables.

- First, the analysis assumes that the valuation of the wind farm is the same as set forth in Public Act 095-0644.
- Second, the tables assume future inflation is constant at 2.25% and the deprecation is 4% until it reaches the maximum of 70% (Appendix 1 and Appendix 2 show the alternative assumption that inflation is at 0% and 1.81% respectively).
- Third, all tax rates are assumed to stay constant at their 2017 (2016 tax year) rates. For example, the Morgan County Tax rate is assumed to stay constant at 1.03295 through 2050.
- Fourth, the analysis assumes that the Project is placed in service on January 1, 2021 for tax purposes at a fair cash value of $141,950,504 according to Public Act 095-0644. The Project is expected to be operational sometime in 2020 but for tax purposes, the tax revenue will be pro-rated based on the percentage of the year that it was operational. Thus, the first full year tax revenue is expected to be Tax Year 2021.
- Fifth, it assumes that the Project is decommissioned in 30 years and pays no more taxes after that date.
- Sixth, since the exact placement of the turbines has not been finalized, the actual taxes paid could vary depending on the relative tax rates between districts.
- Seventh, no comprehensive tax payment was calculated, and these calculations are only to be used to illustrate the economic impact of the Project.

It is likely that the tax revenues from the Project will be greater than the estimates provided in this section.

Taxes in the section are only based on the value of the wind farm and do not include the value of the associated transmission systems and additional equipment and buildings. The value of these other systems will be determined by the county assessors' office and cannot be accurately estimated now. However, the value of the wind farm is determined by state law and is the basis for the tax estimates in this section. Therefore, the tax estimates in this section are conservative and total taxes paid by the Project will likely be

According to Table 6, the taxes paid by the Project to Morgan County starts out at $488,759 but declines due to depreciation (and offset by the trending factor) until it reaches the bottom in 2039. After that, the Project is the maximum of 70% depreciation, and the trending factor causes the taxable value and taxes to increase. The average annual property taxes paid to Morgan County will be $326,115 over 30 years.

Table 6. — Morgan County Tax Revenue from Lincoln Land Wind Project

Tax Year	Taxable Value of Wind Farm	Morgan County
2021	$47,316,835	$488,759
2022	$46,446,205	$479,766
2023	$45,512,443	$470,121
2024	$44,513,148	$459,799
2025	$43,445,844	$448,774
2026	$42,307,977	$437,020
2027	$41,096,911	$424,511
2028	$39,809,929	$411,217
2029	$38,444,227	$397,110
2030	$36,996,915	$382,160
2031	$35,465,011	$366,336
2032	$33,845,442	$349,606
2033	$32,135,039	$331,939
2034	$30,330,533	$313,299
2035	$28,428,556	$293,653
2036	$26,425,635	$272,964
2037	$24,318,190	$251,195
2038	$22,102,533	$228,308
2039	$21,187,350	$218,855
2040	$21,664,065	$223,779
2041	$22,151,507	$228,814
2042	$22,649,916	$233,962
2043	$23,159,539	$239,226
2044	$23,680,628	$244,609
2045	$24,213,443	$250,113
2046	$24,758,245	$255,740
2047	$25,315,306	$261,494
2048	$25,884,900	$267,378
2049	$26,467,310	$273,394
2050	$27,062,825	$279,545
2051	$0	$0
25 YEAR TOTAL		$8,445,893
25 YEAR AVG ANNUAL		$337,836
30 YEAR TOTAL		$9,783,445
30 YEAR AVG ANNUAL		$326,115

Table 6 only illustrates the taxes paid to one taxing body – Morgan County. Table 7 shows an estimate of the likely taxes paid to the road districts (townships) assuming 52.9% are built in Road District 9; 44.9% are built in Road District 8; 1.5% are built in Road District 10; and 0.7% are built in Road District 13. The exact placement of the turbines has not been finalized and the taxes paid could shift between road districts depending on the final placement. In 2021, the road district taxes vary from $140,030 for Road District 9 to $2,136 for Road District 13. The average annual amounts vary from $93,432 for Road District 9 to $1,425 for Road District 13 over 30 years.

Table 7. — Road District Tax Revenue from Lincoln Land Wind Project

Tax Year	Road District 9	Road District 8	Road District 10	Road District 13
2021	$140,030	$130,075	$4,225	$2,136
2022	$137,453	$127,682	$4,147	$2,097
2023	$134,690	$125,115	$4,064	$2,054
2024	$131,733	$122,368	$3,975	$2,009
2025	$128,574	$119,434	$3,879	$1,961
2026	$125,207	$116,306	$3,778	$1,910
2027	$121,623	$112,976	$3,669	$1,855
2028	$117,814	$109,439	$3,555	$1,797
2029	$113,772	$105,684	$3,433	$1,735
2030	$109,489	$101,705	$3,303	$1,670
2031	$104,955	$97,494	$3,167	$1,601
2032	$100,163	$93,042	$3,022	$1,528
2033	$95,101	$88,340	$2,869	$1,451
2034	$89,760	$83,379	$2,708	$1,369
2035	$84,132	$78,151	$2,538	$1,283
2036	$78,204	$72,645	$2,360	$1,193
2037	$71,967	$66,851	$2,171	$1,098
2038	$65,410	$60,760	$1,973	$998
2039	$62,702	$58,245	$1,892	$956
2040	$64,113	$59,555	$1,934	$978
2041	$65,555	$60,895	$1,978	$1,000
2042	$67,030	$62,265	$2,022	$1,022
2043	$68,539	$63,666	$2,068	$1,045
2044	$70,081	$65,099	$2,114	$1,069
2045	$71,657	$66,563	$2,162	$1,093
2046	$73,270	$68,061	$2,211	$1,118
2047	$74,918	$69,592	$2,260	$1,143
2048	$76,604	$71,158	$2,311	$1,168
2049	$78,328	$72,759	$2,363	$1,195
2050	$80,090	$74,396	$2,416	$1,222
2051	$0	$0	$0	$0
25 YEAR TOTAL	$2,419,755	$2,247,735	$73,006	$36,909
25 YEAR AVG ANNUAL	$96,790	$89,909	$2,920	$1,476
30 YEAR TOTAL	$2,802,964	$2,603,703	$84,568	$42,754
30 YEAR AVG ANNUAL	$93,432	$86,790	$2,819	$1,425

Table 8 shows an estimate of the likely taxes paid to the community colleges, fire departments, and library districts. The results assume that 100% of the turbines are placed in Lincoln Land Community College territory. For fire departments, the results assume that 52.9% are built in the Franklin Fire Protection District, 37.7% are built in the Alexander Fire Protection District, 5.8% are not in a fire protection district, 1.4% are built in the New Berlin Township Fire Protection District, 1.4% are built in the Woodson Fire Protection District and 0.7% are built in the Island Grove Township Fire Protection District. . Table 8 assumes that 9.4% of the turbines are built in the West Sangamon Library District and the rest are not in a library district. As shown in Table 8, in 2020, Lincoln Land Community College should receive $231,095; Alexander Fire PD, $65,443; Franklin Fire PD, $19,043; New Berlin Fire PD $2,175; Woodson Fire PD, $1,385; Island Grove Fire PD, $962; and West Sangamon Library $6,475. Alexander Fire PD is expected to receive more tax revenue than Franklin Fire PD even though more turbines are expected to be built in Franklin Fire PD because Alexander's tax rate is 0.36705 but Franklin's is 0.07608. The 30-year average annual amounts are $154,194 for Lincoln Land, $43,666 for Alexander Fire PD, $12,706 for Franklin Fire PD, $1,451 for New Berlin Fire PD, $924 for Woodson Fire PD, $642 for Island Grove Fire PD and $4,320 for West Sangamon Library District.

Table 8. — Tax Revenue from Lincoln Land Wind Project for Other Taxing Bodies

Tax Year	Lincoln Land CC 526	Alexander Fire PD	Franklin Fire PD	New Berlin Fire PD	Woodson Fire PD	Island Grove Fire PD	West Sangamon Library
2021	$231,095	$65,443	$19,043	$2,175	$1,385	$962	$6,475
2022	$226,843	$64,239	$18,692	$2,135	$1,360	$944	$6,356
2023	$222,283	$62,948	$18,317	$2,092	$1,333	$925	$6,228

The largest taxing jurisdictions for property taxes are local school districts. However, the tax implications for school districts are more complicated than for other taxing bodies. School districts receive state aid based on the assessed value of the taxable property within its district. As assessed value increases, the state aid to the school district is decreased. The Center for Renewable Energy at Illinois State University did a report titled Wind Farm Implications for School District Revenue which details how a wind farm affects the local school district's revenue. Although the school district collects increased local property tax revenue from the wind farm, it receives less from General State Aid (GSA) because of the increases in Equalized Assessed Value (EAV) due to the wind farm. However, the reduction in state aid is much smaller than the increased tax revenue.

Although the exact amount of the reduction in General State Aid to the school districts is uncertain, local project tax revenue is superior to relying on GSA for the following reasons: (1) the wind turbines can't relocate – it is a permanent structure that will be within the school district's footprint for the life of the Project; (2) the school district can raise the tax rate and increase its revenues as needed; (3) the school district does not have to deal with the year-to-year uncertainty of GSA amounts; (4) the school district does not have to wait for months (or even into the next Fiscal Year!) for payment; (5) the Project does not increase the overall cost of education in the way that a new residential development would.

Table 9 shows the direct property tax revenue coming from the Project to the Franklin Community Unit School District 1, New Berlin Community Unit School District 16, Waverly Community Unit School District 6, and Jacksonville School District 117 school districts. This tax revenue uses the assumptions outlined earlier to calculate the other tax revenue and assumes that 76.8% of the turbines are built within the Franklin Community Unit School District, 9.4% are built within the New Berlin Community Unit School District, 8.7% are built within the Waverly Community Unit School District, and 5.1% are built within the Jacksonville School District. In 2021, Franklin should receive over $1.6 million; Waverly should receive 209 thousand; New Berlin should receive over $215 thousand; and Jacksonville should receive over $113 thousand. Waverly School District receives more tax revenue than New Berlin District even though is it projected to have fewer turbines because its tax rate is higher at 5.22916 than New Berlin's 4.68956. Over the 30-year life of the project, school districts are expected to receive $43,796,590 in tax revenue.

Table 9. — School District Tax Implications of Lincoln Land Wind Project

Tax Year	Franklin Community Unit School District 1	Waverly Community Unit School District 6	New Berlin Community Unit School District 16	Jacksonville School District 117
2021	$1,650,324	$209,032	$215,154	$113,471

30 YEAR AVG ANNUAL	$1,101,145	$139,472	$143,557	$75,711

Having considered all these benefits, it is still important to determine the net impact of the wind energy project after taking into account the reduction in school funding from the State of Illinois. Determining the reduction in GSA is complicated by the fact that there is a new law for distributing state funds to education.

On August 31, 2017, Governor Rauner signed into law PA 100-0465 that fundamentally changes the way that the state distributes state aid to school districts. The funding consists of two parts – a Base Funding Minimum and a Tier Funding. The Base Funding Minimum in FY18 is based on what the district received in FY 17 under the old funding formula. Some call this the "Hold Harmless" provision and ensures that there are no "losing" districts in the transition to the new funding formula. The Tier Funding is additional money and goes in higher portion to the districts that demonstrate a higher need under the new formula. Because of the "Hold Harmless" provision, no school district will see a reduction in their GSA from what they received in the year before the wind farm was installed. However, the higher EAV caused by the wind farm will reduce its eligibility for new money allocated in the state budget.

There are several sources of uncertainty with the new school funding formula concerning this new money. First, the total amount of new funding to be distributed over the next ten years is unknown at this point. It will be determined year-by-year in the state budget passed by the legislature and signed by the governor. Second, data for the formula funding changes each year based on the school's student population and its "need" and it is difficult to forecast its school's student population over time. Third, each school district is competing with all other school districts for this new funding and so the EAV and student population for all other school districts in the state will impact what a single school district receives. Fourth, the school district's EAV could also change due to other property changes in the district.

In order to determine the net impact of the Project on a school district's eligibility for new GSA money, we can make the following assumptions: (1) that the State of Illinois continues to provide $350 million in NEW state aid to education ANNUALLY. For reference, the new law passed in 2017 provided $350 million and the FY19 state budget has $350 million. Given the current imbalance in the state budget, this a very optimistic assumption; (2) that the school districts will forfeit ALL of the new Tier funding for schools. It seems more likely that the school districts will switch tiers rather than lose all funding; (3) that the school districts would be entitled to the same tiered funding annually for the 10 years covered by the new school funding law without the wind farm; (4) that other school districts in the State of Illinois have a constant EAV and Evidence Based Funding needs.

Franklin School District is expected to have almost 77% of the turbines to be in its taxing area. No other school district is expected to have so many turbines that it will increase its EAV enough to trigger a substantial reduction in its GSA. For FY18, Franklin School District had 91% adequacy and was assigned Tier 3 status and received $7,225 in "new money." For FY 19, Franklin had 89% adequacy and was assigned Tier 2 and received $7,991 in "new money." Overall, Franklin School District will receive $496,711 in GSA in FY19.

Table 10 shows both the total school district tax revenue and net revenue for the Franklin Community Unit School District 1. The reduction in general state aid does not occur until several years after the start of the Project because the state uses a formula that is several years in arrears. For example, the FY18 GSA calculation uses EAV from FY13, FY14 and FY15 in its calculation. Furthermore, it is a 3-year moving average which further delays the full impact of the increased EAV on the state funding formula. The school district should also note that the EAV from the wind farm will also be counted by the state for several years after the wind farm is decommissioned.

The reduction in GSA is cumulative because any new tier funding goes into the Base Funding Minimum in the next year. After 10 years of increases, the reduction levels off as no new funding is expected. The total of net revenue over the thirty years of the Project is expected to be over $32 million for the Franklin School District.

Table 10. — School District Tax Implications of Lincoln Land Wind Project

Tax Year	Franklin Community Unit School District 1	Reduction in GSA	Net Revenue
2021	$1,650,324	$0	$1,650,324
2022	$1,619,958	$0	$1,619,958

30 YEAR TOTAL	$33,034,363	($1,001,539)	$32,032,825
30 YEAR AVG ANNUAL	$1,101,145	($33,385)	$1,067,761

Table 11 shows the sum of all the property taxes listed in Tables 6 through 9 by year. In 2021, the total property tax will be over $3.2 million. It reaches the bottom in 2039 when the project reaches its maximum depreciation and then grows due to the trending factor. Over the 30-year life of the project, the total property taxes paid to the various taxing entities will be overt $65.6 million with an annual average of almost $2.2 million.

Tables 6-11 assume that inflation rises by a constant 2.25%. Appendix A shows the corresponding tax tables under the alternative assumption that inflation does not rise at all, e.g. 0%. Appendix B shows the same tax tables using the assumption that inflation uses by 1.81%. Given historical rates of inflation and the current economic environment, a 2.25 rate of inflation seems much more likely and still quite conservative.

Table 11. — Total Property Tax Revenue from Lincoln Land Wind Project

Tax Year	Total Property Tax
2021	$3,279,784
2022	$3,219,436
2023	$3,154,712
2024	$3,085,446

VII. Appendix A

This appendix replicates the tax analysis in VI. Property Tax using the alternative assumption that inflation does not rise at all rather than the 2.25% inflation assumption that was used in the tables in the main report. All other assumptions remain the same. Below is a list of the corresponding tables from the main report.

Table A-6. — Morgan County Tax Revenue from Lincoln Land Wind Project with 0% inflation

Tax Year	Taxable Value of Wind Farm	Morgan County
2021	$47,316,835	$488,759
2022	$45,424,161	$469,209
2023	$43,531,488	$449,659

VIII. Appendix B

This appendix replicates the tax analysis in VI. Property Tax using the alternative assumption that inflation does not rise at all rather than the 1.81% inflation assumption that was used in the tables in the main report. All other assumptions remain the same. Below is a list of the corresponding tables from the main report.

Table B-6. — Morgan County Tax Revenue from Lincoln Land Wind Project with 1.81% inflation

Tax Year	Taxable Value of Wind Farm	Morgan County
2021	$47,316,835	$488,759

National Renewable Energy Laboratory (NREL), 2008d. Economic Benefits, Carbon Dioxide (CO2) Emissions Reductions,and Water Conservation Benefits from 1,000 Megawatts (MW) of New Wind Power in Montana. Technical Report DOE/GO-102008-2673, October 2008. NREL, Golden, CO. Available at <http://www.nrel.gov/docs/fy09osti/44147.pdf>.

National Renewable Energy Laboratory (NREL), 2008e. Economic Benefits, Carbon Dioxide (CO2) Emissions Reductions, and Water Conservation Benefits from 1,000 Megawatts (MW) of New Wind Power in New Mexico. Technical Report DOE/GO-102008-2679, October 2008. NREL, Golden, CO. Available at <http://www.nrel.gov/docs/fy09osti/44273.pdf>.

National Renewable Energy Laboratory (NREL), 2008f. Economic Benefits, Carbon Dioxide (CO2) Emissions Reductions, and Water Conservation Benefits from 1,000 Megawatts (MW) of New Wind Power in Nevada. Technical Report DOE/GO- 102008-2678, October 2008. NREL, Golden, CO. Available at <http://www.nrel.gov/docs/fy09osti/44271.pdf>.

National Renewable Energy Laboratory (NREL), 2008g. Economic Benefits, Carbon Dioxide (CO2) Emissions Reductions, and Water Conservation Benefits from 1,000 Megawatts (MW) of New Wind Power in Pennsylvania. Technical Report DOE/GO-102008-2680, October 2008. NREL, Golden, CO. Available at <http://www.nrel.gov/docs/fy09osti/44274.pdf>.

National Renewable Energy Laboratory (NREL), 2008h. Economic Benefits, Carbon Dioxide (CO2) Emissions Reductions, and Water Conservation Benefits from 1,000 Megawatts (MW) of New Wind Power in South Dakota. Technical Report DOE/GO-102008-2681, October 2008. NREL, Golden, CO. Available at <http://www.nrel.gov/docs/fy09osti/44275.pdf>.

National Renewable Energy Laboratory (NREL), 2008i. Economic Benefits, Carbon Dioxide (CO2) Emissions Reductions,and Water Conservation Benefits from 1,000 Megawatts (MW) of New Wind Power in Utah. Technical Report DOE/GO-102008-2677, October 2008. NREL, Golden, CO. Available at <http://www.nrel.gov/docs/fy09osti/44268.pdf>.

National Renewable Energy Laboratory (NREL), 2008j. Economic Benefits, Carbon Dioxide (CO2) Emissions Reductions, and Water Conservation Benefits from 1,000 Megawatts (MW) of New Wind Power in West Virginia. Technical Report DOE/GO-102008-2682, October 2008. NREL, Golden, CO. Available at <http://www.nrel.gov/docs/fy09osti/44276.pdf>.

National Renewable Energy Laboratory (NREL), 2008k. Economic Benefits, Carbon Dioxide (CO2) Emissions Reductions, and Water Conservation Benefits from 1,000 Megawatts (MW) of New Wind Power in Wisconsin. Technical Report DOE/GO-102008-2683, October 2008. NREL, Golden, CO. Available at <http://www.nrel.gov/docs/fy09osti/44277.pdf>.

National Renewable Energy Laboratory (NREL), 2009. Economic Benefits, Carbon Dioxide (CO2) Emissions Reductions, and Water Conservation Benefits from 1,000 Megawatts (MW) of New Wind Power in North Carolina. Technical Report DOE/GO-102009-2755, March 2009. NREL, Golden, CO. Available at <www.nrel.gov/docs/fy09osti/44916.pdf>.

National Renewable Energy Laboratory (NREL), 2013. Estimated Economic Impacts of Utility Scale Wind Power in Iowa. Technical Report NREL/TP-6A20-53187, November 2013. NREL, Golden, CO. Available at < http://www.nrel.gov/docs/fy14osti/53187.pdf>.

National Renewable Energy Laboratory (NREL), 2014. Economic Impacts from Indiana's First 1,000 Megawatts of Wind Power. Technical Report NREL/TP-5000-60914, August 2014. NREL, Golden, CO. Available at < http://www.nrel.gov/docs/fy14osti/60914.pdf>.

X. Curriculum Vita - David Loomis

David G. Loomis
Illinois State University
Department of Economics
Campus Box 4200
Normal, IL 61790-4200
(309) 438-7979
dloomis@ilstu.edu

Education

Doctor of Philosophy, Economics, Temple University, Philadelphia, Pennsylvania, May 1995.

Bachelor of Arts, Mathematics and Honors Economics, Temple University, Magna Cum Laude, May 1985.

Experience

1996-present Illinois State University, Normal, IL
Full Professor – Department of Economics (2010-present)
Associate Professor - Department of Economics (2002-2009)
Assistant Professor - Department of Economics (1996-2002)

- Taught Regulatory Economics, Telecommunications Economics and Public Policy, Industrial Organization and Pricing, Individual and Social Choice, Economics of Energy and Public Policy and a Graduate Seminar Course in Electricity, Natural Gas and Telecommunications Issues.
- Supervised as many as 5 graduate students in research projects each semester.
- Served on numerous departmental committees.

1997-present Institute for Regulatory Policy Studies, Normal, IL
Executive Director (2005-present)
Co-Director (1997-2005)

- Grew contributing membership from 5 companies to 16 organizations.
- Doubled the number of workshop/training events annually.
- Supervised 2 Directors, Administrative Staff and internship program.
- Developed and implemented state-level workshops concerning regulatory issues related to the electric, natural gas, and telecommunications industries.

Experience (cont'd)

2006-2018 Illinois Wind Working Group, Normal, IL
Director

- Founded the organization and grew the organizing committee to over 200 key wind stakeholders
- Organized annual wind energy conference with over 400 attendees
- Organized strategic conferences to address critical wind energy issues
- Initiated monthly conference calls to stakeholders
- Devised organizational structure and bylaws

2007-2018 Center for Renewable Energy, Normal, IL
Director

- Created founding document approved by the Illinois State University Board of Trustees and Illinois Board of Higher Education.
- Secured over $150,000 in funding from private companies.
- Hired and supervised 4 professional staff members and supervised 3 faculty members as Associate Directors.
- Reviewed renewable energy manufacturing grant applications for Illinois Department of Commerce and Economic Opportunity for a $30 million program.
- Created technical "Due Diligence" documents for the Illinois Finance Authority loan program for wind farm projects in Illinois.

2011-present Strategic Economic Research, LLC
President

- Performed economic impact analyses on policy initiatives and energy projects such as wind energy, solar energy, natural gas plants and transmission lines at the county and state level.
- Provided expert testimony before state legislative bodies, state public utility commissions, and county boards.
- Wrote telecommunications policy impact report comparing Illinois to other Midwestern states.

1997-2002 International Communications Forecasting Conference
Chair

- Expanded Planning Committee with representatives from over 18 different international companies and delivered high quality conference attracting over 500 people over 4 years.

Experience (cont'd)

1985-1996 Bell Atlantic, Philadelphia, Pa.
Economist - Business Research

- Wrote and taught Applied Business Forecasting multimedia course.
- Developed and documented 25 econometric demand models that were used in regulatory filings.
- Provided statistical and analytic support to regulatory costing studies.
- Served as subject matter expert in switched and special access.
- Administered $4 million budget including $1.8 million consulting budget.

Professional Awards and Memberships

2016 Outstanding Cross-Disciplinary Team Research Award with Jin Jo and Matt Aldeman – recognizes exemplary collaborative research conducted by multiple investigators from different disciplines.

2011 Midwestern Regional Wind Advocacy Award from the U. S. Department of Energy's Wind Powering America presented at WindPower 2011

2009 Economics Department Scott M. Elliott Faculty Excellence Award – awarded to faculty who demonstrate excellence in teaching, research and service.

2009 Illinois State University Million Dollar Club – awarded to faculty who have over $1 million in grants through the university.

2008 Outstanding State Wind Working Group Award from the U. S. Department of Energy's Wind Power America presented at WindPower 2008.

1999 Illinois State University Teaching Initiative Award

Member of the American Economic Association, National Association of Business Economists, International Association for Energy Economics, Institute for Business Forecasters; Institute for International Forecasters, International Telecommunications Society.

Expert Testimony

23. McLean County (Illinois) Zoning Board of Appeals, Application for Special Use Permit for a Wind Energy Conversion System, on behalf of Invenergy, LLC, Direct Oral Testimony, January 4, 2018.

22. New Mexico Public Regulation Commission, Case No. 17-00275-UT, Application of Sagamore Wind Energy LLC, on behalf of Invenergy, LLC, Direct Written Testimony filed November 6, 2017.

Expert Testimony (cont'd)

21. Ohio Power Siting Board, Case No. 17-773-EL-BGN, In the Matter of Hardin Solar Energy LLC for a Certificate of Environmental Compatibility and Public Need to Construct a Solar-Powered Electric Generation Facility in Hardin County, Ohio, on behalf of Invenergy, LLC, Exhibit with Report filed July 5, 2017.

20. Macon County (Illinois) Environmental, Education, Health and Welfare Committee, Application for Special Use Permit for a Wind Energy Conversion System, on behalf of E.ON Energy, Direct Oral Testimony, August 20, 2015.

19. Illinois Commerce Commission, Case No. 15-0277, Oral Cross-examination Testimony on behalf of Grain Belt Express Clean Line LLC appeared before the Commission on August 19, 2015.

18. Macon County (Illinois) Zoning Board of Appeals, Application for Special Use Permit for a Wind Energy Conversion System, on behalf of E.ON Energy, Direct Oral Testimony, August 11, 2015.

17. Illinois Commerce Commission, Case No. 15-0277, Written Rebuttal Testimony on behalf of Grain Belt Express Clean Line LLC filed August 7, 2015.

16. Kankakee County (Illinois) Planning, Zoning, and Agriculture Committee, Application for Special Use Permit for a Wind Energy Conversion System, on behalf of EDF Renewables, Direct Oral Testimony, July 22, 2015.

15. Kankakee County (Illinois) Zoning Board of Appeals, Application for Special Use Permit for a Wind Energy Conversion System, on behalf of EDF Renewables, Direct Oral Testimony, July 13, 2015.

14. Bureau County (Illinois) Zoning Board of Appeals, Application for Special Use Permit for a Wind Energy Conversion System, on behalf of Berkshire Hathaway Energy/Geronimo Energy, Direct Oral Testimony, June 16, 2015.

13. Illinois Commerce Commission, Case No. 15-0277, Written Direct Testimony on behalf of Grain Belt Express Clean Line LLC filed April 10, 2015.

12. Livingston County (Illinois) Zoning Board of Appeals, Application for Special Use Permit for a Wind Energy Conversion System, on behalf of Invenergy, Oral Cross-Examination, December 8-9, 2014.

Expert Testimony (cont'd)

11. Missouri Public Service Commission, Case No. EA-2014-0207, Oral Cross-examination Testimony on behalf of Grain Belt Express Clean Line LLC appeared before the Commission on November 21, 2014.

10. Livingston County (Illinois) Zoning Board of Appeals, Application for Special Use Permit for a Wind Energy Conversion System, on behalf of Invenergy, Direct Oral Testimony, November 17-19, 2014.

9. Missouri Public Service Commission, Case No. EA-2014-0207, Written Surrebuttal Testimony on behalf of Grain Belt Express Clean Line LLC, filed October 14, 2014.

8. Missouri Public Service Commission, Case No. EA-2014-0207, Written Direct Testimony on behalf of Grain Belt Express Clean Line LLC, filed March 26, 2014.

7. Illinois Commerce Commission, Case No. 12-0560, Oral Cross-examination Testimony on behalf of Rock Island Clean Line LLC appeared before the Commission on December 11, 2013.

6. Illinois Commerce Commission, Case No. 12-0560, Written Rebuttal Testimony on behalf of Rock Island Clean Line LLC filed August 20, 2013.

5. Boone County (Illinois) Board, Examination of Wind Energy Conversion System Ordinance, Direct Testimony and Cross-Examination, April 23, 2013.

4. Illinois Commerce Commission, Case No. 12-0560, Written Direct Testimony on behalf of Rock Island Clean Line LLC filed October 10, 2012.

3. Whiteside County (Illinois) Board and Whiteside County Planning and Zoning Committee, Examination of Wind Energy Conversion System Ordinance, Direct Testimony and Cross-Examination, on behalf of the Center for Renewable Energy, April 12, 2012.

2. State of Illinois Senate Energy and Environment Committee, Direct Testimony and Cross-Examination, on behalf of the Center for Renewable Energy, October 28, 2010.

1. Livingston County (Illinois) Zoning Board of Appeals, Application for Special Use Permit for a Wind Energy Conversion System, on behalf of the Center for Renewable Energy, Direct Testimony and Cross-Examination, July 28, 2010.

Selected Presentations

"Smart Cities and Micro Grids: Cost Recovery Issues," presented September 12,2017 at the National Association of Regulatory Utility Commissioners Staff Subcommittee on Accounting and Finance Meeting, Springfield, IL.

"Cloud Computing: Regulatory Principles and ICC NOI," presented September 11,2017 at the National Association of Regulatory Utility Commissioners Staff Subcommittee on Accounting and Finance Meeting, Springfield, IL.

"Illinois Wind, Illinois Solar and the Illinois Future Energy Jobs Act," presented July 25, 2017 at the Illinois County Assessors Meeting, Normal, IL.

"Illinois Wind, Illinois Solar and the Illinois Future Energy Jobs Act," presented April 21, 2017 at the Illinois Association of County Zoning Officers Meeting, Bloomington, IL.

"Energy Storage Economics and RTOs," presented October 30, 2016 at the Energy Storage Conference at Argonne National Laboratory.

"Wind Energy in Illinois," on October 6, 2016 at the B/N Daybreak Rotary Club, Bloomington, IL.

"Smart Grid for Schools," presented August 17, 2016 to the Ameren External Affairs Meeting, Decatur, IL.

"Solar Energy in Illinois," presented July 28, 2016 at the 3rd Annual K-12 Teachers Clean Energy Workshop, Richland Community College, Decatur, IL

"Wind Energy in Illinois," presented July 28, 2016 at the 3rd Annual K-12 Teachers Clean Energy Workshop, Richland Community College, Decatur, IL

"Smart Grid for Schools," presented June 21, 2016 at the ISEIF Grantee and Ameren Meeting, Decatur, IL.

"Costs and Benefits of Renewable Energy," presented November 4, 2015 at the Osher Lifelong Learning Institute at Bradley, University, Peoria, IL.

"Energy Sector Workforce Issues," presented September 17, 2015 at the Illinois Workforce Investment Board, Springfield, IL.

"The Past, Present and Future of Wind Energy in Illinois," presented March 13, 2015 at the Peoria Rotary Club, Peoria, IL.

"Where Are All the Green Jobs?" presented January 28, 2015 at the 2015 Illinois Green Economy Network Sustainability Conference, Normal, IL.

Presentations (cont'd)

"Teaching Next Generation Energy Concepts with Next Generation Science Standards: Addressing the Critical Need for a More Energy-Literate Workforce," presented September 30, 2014 at the Mathematics and Science Partnerships Program 2014 Conference in Washington, DC.

"National Utility Rate Database," presented October 23, 2013 at Solar Power International, Chicago, IL.

"Potential Economic Impact of Offshore Wind Energy in the Great Lakes," presented May 6, 2013 at WindPower 2013, Chicago, IL.

"Why Illinois? Windy City, Prairie Power," presented May 5, 2013 at WindPower 2013, Chicago, IL.

"National Utility Rate Database," presented January 29, 2013 at the EUEC Conference, Phoenix, AZ.

"Energy Learning Exchange and Green Jobs," presented December 13, 2012 at the TRICON Meeting of Peoria and Tazewell County Counselors, Peoria, IL.

"Potential Economic Impact of Offshore Wind Energy in the Great Lakes," presented November 12, 2012 at the Offshore Wind Jobs and Economic Development Impacts Webinar.

"Energy Learning Exchange," presented October 31, 2012 at the Utility Workforce Development Meeting, Chicago, IL.

"Wind Energy in McLean County," presented June 26, 2012 at BN By the Numbers, Normal, IL.

"Wind Energy," presented June 14, 2012 at the Wind for Schools Statewide Teacher Workshop, Normal, IL.

"Economic Impact of Wind Energy in Illinois," presented June 6, 2012 at AWEA's WINDPOWER 2012, Atlanta, GA.

"Trends in Illinois Wind Energy," presented March 6, 2012 at the AWEA Regional Wind Energy Summit – Midwest in Chicago, IL.

"Challenges and New Growth Strategies in the Wind Energy Business," invited plenary session speaker at the Green Revolution Leaders Forum, November 18, 2011 in Seoul, South Korea.

"Overview of the Center for Renewable Energy," presented July 20, 2011 at the University-Industry Consortium Meeting at Illinois Institute of Technology, Chicago, IL.

Presentations (cont'd)

"Building the Wind Turbine Supply Chain," presented May 11, 2011 at the Supply Chain Growth Conference, Chicago, IL

"Building a Regional Energy Policy for Economic Development," presented April 4, 2011 at the Midwestern Legislative Conference's Economic Development Committee Webinar.

"Wind Energy 101," presented February 7, 2011 at the Wind Power in Central Illinois - A Public Forum, CCNET Renewable Energy Group, Champaign, IL.

"Alternative Energy Strategies," presented with Matt Aldeman November 19, 2010 at the Innovation Talent STEM Education Forum, Chicago, IL.

"Siting and Zoning in Illinois," presented November 17, 2010 at the Wind Powering America Webinar.

"What Governor Quinn Should Do about Energy?" presented November 15, 2010 at the Illinois Chamber of Commerce Energy Forum Conference, Chicago, IL.

"Is Wind Energy Development Right for Illinois," presented with Matt Aldeman October 28, 2010 at the Illinois Association of Illinois County Zoning Officials Annual Seminar in Utica, IL.

"Economic Impact of Wind Energy in Illinois," presented July 22, 2010 at the AgriEnergy Conference in Champaign, IL.

"Renewable Energy Major at ISU," presented July 21, 2010 at Green Universities and Colleges Subcommittee Webinar.

"Economics of Wind Energy," presented May 19, 2010 at the U.S. Green Building Council meeting in Chicago, IL.

"Forecasting: A Primer for the Small Business Entrepreneur," presented with James E. Cox, Jr. April 14, 2010 at the Allied Academies' Spring International Conference in New Orleans, LA.

"Are Renewable Portfolio Standards a Policy Cure-All? A Case Study of Illinois' Experience," presented January 30, 2010 at the 2010 William and Mary Environmental Law and Policy Review Symposium in Williamsburg, VA.

"Creating Partnerships between Universities and Industry," presented November 19, 2009, at New Ideas in Educating a Workforce in Renewable Energy and Energy Efficiency in Albany, NY.

"Educating Illinois in Renewable Energy, presented November 14, 2009 at the Illinois Science Teachers Association in Peoria, IL.

Presentations (cont'd)

"Green Collar Jobs," invited presentation October 14, 2009 at the 2009 Workforce Forum in Peoria, IL.

"The Role of Wind Power in Illinois," presented March 4, 2009 at the Association of Illinois Electric Cooperatives Engineering Seminar in Springfield, IL.

"The Economic Benefits of Wind Farms," presented January 30, 2009 at the East Central Illinois Economic Development District Meeting in Champaign, IL.

"Green Collar Jobs in Illinois," presented January 6, 2009 at the Illinois Workforce Investment Board Meeting in Macomb, Illinois.

"Green Collar Jobs: What Lies Ahead for Illinois?" presented August 1, 2008 at the Illinois Employment and Training Association Conference.

"Mapping Broadband Access in Illinois," presented October 16, 2007 at the Rural Telecon '07 conference.

"A Managerial Approach to Using Error Measures to Evaluate Forecasting Methods," presented October 15, 2007 at the International Academy of Business and Economics.

"Dollars and Sense: The Pros and Cons of Renewable Fuel," presented October 18, 2006 at Illinois State University Faculty Lecture Series.

"Broadband Access in Illinois," presented July 28, 2006 at the Illinois Association of Regional Councils Annual Meeting.

"Broadband Access in Illinois," presented November 17, 2005 at the University of Illinois' Connecting the e to Rural Illinois.

"Improving Forecasting Through Textbooks – A 25 Year Review," with James E. Cox, Jr., presented June 14, 2005 at the 25th International Symposium on Forecasting.

"Telecommunications Demand Forecasting with Intermodal Competition, with Christopher Swann, presented April 2, 2004 at the Telecommunications Systems Management Conference 2004.

"Intermodal Competition," with Christopher Swann, presented April 3, 2003 at the Telecommunications Systems Management Conference 2003.

Presentations (cont'd)

"Intermodal Competition in Local Exchange Markets," with Christopher Swann, presented June 26, 2002 at the 20th Annual International Communications Forecasting Conference.

"Assessing Retail Competition," presented May 23, 2002 at the Institute for Regulatory Policy Studies' Illinois Energy Policy for the 21st Century workshop.

"The Devil in the Details: An Analysis of Default Service and Switching," with Eric Malm presented May 24, 2001 at the 20th Annual Advanced Workshop on Regulation and Competition.

"Forecasting Challenges for U.S. Telecommunications with Local Competition," presented June 28, 1999 at the 19th International Symposium on Forecasting.

"Acceptance of Forecasting Principles in Forecasting Textbooks," presented June 28, 1999 at the 19th International Symposium on Forecasting.

"Forecasting Challenges for Telecommunications With Local Competition," presented June 17, 1999 at the 17th Annual International Communications Forecasting Conference.

"Measures of Market Competitiveness in Deregulating Industries," with Eric Malm, presented May 28, 1999 at the 18th Annual Advanced Workshop on Regulation and Competition.

"Trends in Telecommunications Forecasting and the Impact of Deregulation," Proceedings of EPRI's 11th Forecasting Symposium, 1998.

"Forecasting in a Competitive Age: Utilizing Macroeconomic Forecasts to Accurately Predict the Demand for Services," invited speaker, Institute for International Research Conference, September 29, 1997.

"Regulatory Fairness and Local Competition Pricing," presented May 30, 1996 at the 15th Annual Advanced Workshop in Regulation and Public Utility Economics.

"Optimal Pricing For a Regulated Monopolist Facing New Competition: The Case of Bell Atlantic Special Access Demand," presented May 28, 1992 at the Rutgers Advanced Workshop in Regulation and Public Utility Economics.

Grants

"SmartGrid for Schools 2018 and Energy Challenge," with William Hunter, Illinois Science and Energy Innovation Foundation, RSP Award # A15-0092-002 - extended, January 2017, $300,000.

"Energy Learning Exchange - Implementing Nationally Recognized Energy Curriculum and Credentials in Illinois," Northern Illinois University, RSP Award # A17-0098, February, 2017, $13,000.

"SmartGrid for Schools 2017 and Energy Challenge," with William Hunter, Illinois Science and Energy Innovation Foundation, RSP Award # A15-0092-002 - extended, January 2017, $350,000.

"Illinois Jobs Project," University of California Berkeley, RSP Award # A16-0148, August, 2016, $10,000.

"Energy Workforce Ready Through Building Performance Analysis," Illinois Department of Commerce and Economic Opportunity through the Department of Labor, RSP # A16-0139, June, 2016, $328,000 (grant was de-obligated before completion).

"SmartGrid for Schools 2016 and Smart Appliance Challenge," with William Hunter, Brad Christenson and Jeritt Williams, Illinois Science and Energy Innovation Foundation, RSP Award # A15-0092-002, January 2016, $450,000.

"SmartGrid for Schools 2015," with William Hunter and Matt Aldeman, Illinois Science and Energy Innovation Foundation, RSP Award # A15-0092-001, February 2015, $400,000.

"Economic Impact of Nuclear Plant Closings: A Response to HR 1146," Illinois Department of Economic Opportunity, RSP Award # 14-025001 amended, January, 2015, $22,000.

"Partnership with Midwest Renewable Energy Association for Solar Market Pathways" with Missy Nergard and Jin Jo, U.S. Department of Energy Award Number DE-EE0006910, October, 2014, $109,469 (ISU Award amount).

"Renewable Energy for Schools," with Matt Aldeman and Jin Jo, Illinois Department of Commerce and Economic Opportunity, Award Number 14-025001, June, 2014, $130,001.

"SmartGrid for Schools 2014," with William Hunter and Matt Aldeman, Illinois Science and Energy Innovation Foundation, RSP # 14B116, March 2014, $451,701.

"WINDPOWER 2014 Conference Exhibit," Illinois Department of Commerce and Economic Opportunity, RSP #14C167, March, 2014, $95,000.

Grants (cont'd)

"Lake Michigan Offshore Wind Energy Buoy," with Matt Aldeman, Illinois Clean Energy Community Foundation, Request ID 6435, November, 2013, $90,000.

"Teaching Next Generation Energy Concepts with Next Generation Science Standards," with William Hunter, Matt Aldeman and Amy Bloom, Illinois State Board of Education, RSP # 13B170A, October, 2013, second year, $159,954; amended to $223,914.

"Solar for Schools," with Matt Aldeman, Illinois Green Economy Network, RSP # 13C280, August, 2013, $66,072.

"Energy Learning Exchange Implementation Grant," with William Hunter and Matt Aldeman, Illinois Department of Commerce and Economic Opportunity, Award Number 13-052003, June, 2013, $350,000.

"Teaching Next Generation Energy Concepts with Next Generation Science Standards," with William Hunter, Matt Aldeman and Amy Bloom, Illinois State Board of Education, RSP # 13B170, April, 2013, $159,901.

"Illinois Sustainability Education SEP," Illinois Department of Commerce and Economic Opportunity, Award Number 08-431006, March, 2013, $225,000.

"Illinois Pathways Energy Learning Exchange Planning Grant," with William Hunter and Matt Aldeman, Illinois State Board of Education (Source: U.S. Department of Education), RSP # 13A007, December, 2012, $50,000.

"Illinois Sustainability Education SEP," Illinois Department of Commerce and Economic Opportunity, Award Number 08-431005, June 2011, amended March, 2012, $98,911.

"Wind for Schools Education and Outreach," with Matt Aldeman, Illinois Department of Commerce and Economic Opportunity, Award Number 11-025001, amended February, 2012, $111,752.

"A Proposal to Support Solar Energy Potential and Job Creation for the State of Illinois Focused on Large Scale Photovoltaic System," with Jin Jo (lead PI), Illinois Department of Commerce and Economic Opportunity, Award Number 12-025001, January 2012, $135,000.

"National Database of Utility Rates and Rate Structure," U.S. Department of Energy, Award Number DE-EE0005350TDD, 2011-2014, $850,000.

"Illinois Sustainability Education SEP," Illinois Department of Commerce and Economic Opportunity, Award Number 08-431005, June 2011, $75,000.

Grants (cont'd)

"Wind for Schools Education and Outreach," with Matt Aldeman, Illinois Department of Commerce and Economic Opportunity, Award Number 11-025001, March 2011, $190,818.

"Using Informal Science Education to Increase Public Knowledge of Wind Energy in Illinois," with Amy Bloom and Matt Aldeman, Scott Elliott Cross-Disciplinary Grant Program, February 2011, $13,713.

"Wind Turbine Market Research," with Matt Aldeman, Illinois Manufacturers Extension Center, May, 2010, $4,000.

"Petco Resource Assessment," with Matt Aldeman, Petco Petroleum Co., April, 2010 amended August 2010 $34,000; original amount $18,000.

"Wind for Schools Education and Outreach," with Anthony Lornbach and Matt Aldeman, Scott Elliott Cross-Disciplinary Grant Program, February, 2010, $13,635.

"IGA IFA/ISU Wind Due Diligence," Illinois Finance Authority, November, 2009, $8,580 amended December 2009; original amount $2,860.

"Green Industry Business Development Program, with the Shaw Group and Illinois Manufacturers Extension Center, Illinois Department of Commerce and Economic Opportunity, Award Number 09-021007, August 2009, $245,000.

"Wind Turbine Workshop Support," Illinois Department of Commerce and Economic Opportunity, June 2009, $14,900.

"Illinois Wind Workers Group," with Randy Winter, U.S. Department of Energy, Award Number DE-EE0000507, 2009-2011, $107,941.

"Wind Turbine Supply Chain Study," with J. Lon Carlson and James E. Payne, Illinois Department of Commerce and Economic Opportunity, Award Number 09-021003, April 2009, $125,000.

"Renewable Energy Team Travel to American Wind Energy Association WindPower 2009 Conference, Center for Mathematics, Science and Technology, February 2009, $3,005.

"Renewable Energy Educational Lab Equipment," with Randy Winter and David Kennell, Illinois Clean Energy Community Foundation (peer-reviewed), February, 2008, $232,600.

Grants (cont'd)

"Proposal for New Certificate Program in Electricity, Natural Gas and Telecommunications Economics," with James E. Payne, Extended Learning Program Grant, April, 2007, $29,600.

"Illinois Broadband Mapping Study," with J. Lon Carlson and Rajeev Goel, Illinois Department of Commerce and Economic Opportunity, Award Number 06-205008, 2006-2007, $75,000.

"Illinois Wind Energy Education and Outreach Project," with David Kennell and Randy Winter, U.S. Department of Energy, Award Number DE-FG36-06GO86091, 2006-2010, $990,000.

"Wind Turbine Installation at Illinois State University Farm," with Doug Kingman and David Kennell, Illinois Clean Energy Community Foundation (peer-reviewed), May, 2004, $500,000.

"Illinois State University Wind Measurement Project," Doug Kingman and David Kennell, Illinois Clean Energy Community Foundation (peer-reviewed), with August, 2003, $40,000.

"Illinois State University Wind Measurement Project," with Doug Kingman and David Kennell, NEG Micon matching contribution, August, 2003, $65,000.

"Distance Learning Technology Program," Illinois State University Faculty Technology Support Services, Summer 2002, $3,000.

"Providing an Understanding of Telecommunications Technology By Incorporating Multimedia into Economics 235," Instructional Technology Development Grant (peer-reviewed), January 15, 2001, $1,400.

"Using Real Presenter to create a virtual tour of GTE's Central Office," with Jack Chizmar, Instructional Technology Literacy Mentoring Project Grant (peer-reviewed), January 15, 2001, $1,000.

"An Empirical Study of Telecommunications Industry Forecasting Practices," with James E. Cox, College of Business University Research Grant (peer-reviewed), Summer, 1999, $6,000.

"Ownership Form and the Efficiency of Electric Utilities: A Meta-Analytic Review" with L. Dean Hiebert, Institute for Regulatory Policy Studies research grant (peer-reviewed), August 1998, $6,000.

Total Grants: $7,740,953

External Funding

Corporate Funding for Institute for Regulatory Policy Studies, Ameren ($7,500), Aqua Illinois ($7,500); Commonwealth Edison ($7,500); Exelon ($7,500); Illinois American Water ($7,500); Midcontinent ISO ($7,500); NICOR Energy ($7,500); People Gas Light and Coke ($7,500); PJM Interconnect ($7,500); Fiscal Year 2017, $67,500 total.

Workshop Surplus for Institute for Regulatory Policy Studies, with Adrienne Ohler, Fiscal Year 2017, $18,342.

Corporate Funding for Institute for Regulatory Policy Studies, Ameren ($7,500), Aqua Illinois ($7,500); Commonwealth Edison ($7,500); Exelon ($7,500); Illinois American Water ($7,500) ITC Holdings ($7,500); Midcontinent ISO ($7,500); NICOR Energy ($7,500); People Gas Light and Coke ($7,500); PJM Interconnect ($7,500); Fiscal Year 2017, $75,000 total.

Workshop Surplus for Institute for Regulatory Policy Studies, with Adrienne Ohler, Fiscal Year 2016, $19,667.

Corporate Funding for Energy Learning Exchange, Calendar Year 2016, $53,000.

Corporate Funding for Institute for Regulatory Policy Studies, Ameren ($7,500), Aqua Illinois ($7,500); Commonwealth Edison ($7,500); Exelon/Constellation NewEnergy ($7,500); Illinois American Water ($7,500) ITC Holdings ($7,500); Midcontinent ISO ($7,500); NICOR Energy ($7,500); People Gas Light and Coke ($7,500); PJM Interconnect ($7,500); Utilities, Inc. ($7,500) Fiscal Year 2016, $82,500 total.

Workshop Surplus for Institute for Regulatory Policy Studies, with Adrienne Ohler, Fiscal Year 2015, $15,897.

Corporate Funding for Institute for Regulatory Policy Studies, Ameren ($7,500), Alliance Pipeline ($7,500); Aqua Illinois ($7,500); AT&T ($7,500);Commonwealth Edison ($7,500); Exelon/ Constellation NewEnergy ($7,500); Illinois American Water ($7,500) ITC Holdings ($7,500); Midcontinent ISO ($7,500); NICOR Energy ($7,500); People Gas Light and Coke ($7,500); PJM Interconnect ($7,500); Fiscal Year 2015, $90,000 total.

Corporate Funding for Energy Learning Exchange, Calendar Year 2014, $55,000.

Workshop Surplus for Institute for Regulatory Policy Studies, with Adrienne Ohler, Fiscal Year 2014, $12,381.

XI. Erratum/ Corrigendum

p. 8 A previous version of this report erroneously listed the county population density as 27.3. The correct population density for Morgan County is 62.5 and it has been corrected in this version of the report.

This correction does not change the fact that Morgan County is less densely populated than the State of Illinois as a whole. This error is in a section of background information on Morgan County and not in the analysis on economic impacts or tax revenue. Further, this number was NOT used in the analysis on economic impacts or tax revenue and no further adjustments need to be made to any of the results or conclusions.

Strategic Economic Research, LLC

Economic Impact Analysis for
Lincoln Land Wind Project
in Morgan County, IL

Appendix 6 – Community Grants Program

Lincoln Land Wind Community Grant Program

Apex Clean Energy is pleased to support educators, entrepreneurs, and changemakers in the Sangamon and Morgan County community. One small way we can do this is by giving back through the Lincoln Land Wind Community Grant program. Through its grant program, Lincoln Land Wind's primary has become a strong community partner to which many programs, non-profit organizations have turned to assist with pressing community needs, help enrich lives, and make a meaningful impact in Morgan county.

Our goal continues to be to fund projects and programs which build healthy communities, create economic opportunity, encourage environmental sustainability and promote education. Following are the four categories awarded grants fall into:

A) **Building Healthy Communities**:
Programs that support good government, open communication, citizen resources, and/or enhance the quality of life in the community. Applicants must demonstrate how the program or event contributes to these social goals.

B) **Economic Development**:
Apex Clean Energy supports and encourages the entrepreneurial spirit. It is part of our mission to serve as a catalyst for economic opportunity and development within the communities where we operate.

C) **Environmental Sustainability**:
Programs that possess a strong link to environmental revitalization, sustainability, or education thereof, empower residents to be stewards of the environment, and/or encourage partnerships to address environmental concerns and sustainability. Participating organizations must have a credible record of success in environmental performance.

D) **Promoting Education**:
Programs that support educational institutions, the advancement of science, technology, engineering, and math (STEM), and training programs for careers in the wind industry. This may include curriculum development, literacy, school readiness, and other initiatives that help students grow into young leaders. Vocational training institutions that help build a skilled workforce are also included and encouraged to apply.

Apex Clean Energy is proud to be a part of an industry bringing economic opportunity to rural America, which has not always shared in the economic investment urban and suburban communities have benefitted from during the most recent economic recovery

Below is an overview of the grants and sponsorships made by Lincoln Land Wind since the summer of 2018 to organizations operating in Morgan County. Of course, most grant awards fit into more than one category.

Lincoln Land Wind made multiple grants **to Franklin School District** to fund student activities and new technologies, including:

- The 2019's high school **freshman class holiday music festival**;

- Purchase of a **programmable ball robot** designed to teach basic programming to elementary students and allow teachers to incorporate STEM-themed lessons into their daily plans;
- Franklin Junior High's **March to Memphis,** which allows 7th and 8th grade students to learn about civil rights and black history.
- Lincoln Land's support of student athletic activities included **a three on three Basketball tournament,** the **South County Vipers Girls' Vipers Volleyball**; **physical education equipment** for the elementary school; and the **Girls Cross Country Track Team.**
- Purchase and installation of **Electronic blackboards** and **white boards** to enable teachers to bring class lessons to life.
- Purchase of a **new fume hood for the chemistry classroom** to enable Franklin High School to add a second-level chemistry. By providing needed ventilation, the new fume hood is protecting students from fumes as they advance their understanding of chemistry.

Supporting students throughout Morgan County is important to the Lincoln Land Wind team. Many organizations which provide or advance youth education offered us the opportunity to fund their good work:

- One grant award allowed us to honor our friend and Lincoln Land landowner **Donald** and his wife **Gene Ann (Woodson) Johnson.** Both were graduates of **Routt Catholic High School,** and so were proud to make a gift to fund **renovations of the high school lab facilities**. Routt's science teachers were planned the new labs to create an environment conducive to maximum student engagement and learning.
- The Journal Courier hosted an **awards banquet for high school students** from every school in Morgan County. Area colleges coalesced around the event and provided scholarships which were given in recognition of outstanding scholarship and as an incentive to attend college.
- Each year since 2014 the **Jacksonville Promise** raises money to provide scholarships to Jacksonville students to attend local schools. By donating to the 2019 dinner, the Lincoln Land team helped organizers increase the amount of money they raised.
- Organizations like **the Future Farmers of America** play an important role in educating young people not only in agriculture, but in leadership. We were proud to provide a scholarship for one student to attend the National FFA Washington Leadership Conference.

In addition to funding educational programs the Lincoln Land team made a series of grants to organizations which improve the quality of life. These included:

- **Alexander Volunteer Fire Department** serves the unincorporated Village of Alexander as well as surrounding communities in an emergency. Seconds count during an emergency response. In the event of an electric outage, the fire hall's garage doors must be opened manually which adds minutes to response time. **This grant will fund the purchase and installation of a generator to ensure the fire hall has electric service at all times.** Not only will this enable the fire company to respond quickly, but allow the fire hall to be used as a community warming center.

- **Prairie Land United Way** to assist with youth camps, adult services, emergency services, education, crisis intervention, and child development in Morgan County. As Executive Director Karen Walker stated, “These dollars will go a long way to helping us to improve education, health and income of area residents in 2019, and our longer-term goal of building strong communities,” We are proud to be able to support Prairie Land United Way again in 2020.

- **Village of Franklin** to improve safety by funding the **purchase and installation of rubber mulch at the Franklin playground**. The playground is used by residents and visitors and by the children that attend the Franklin elementary school. According to Franklin officials, this grant was a triple win. By using a recycled material, it helped the environment, made the playground safer for children and reduced maintenance costs.

- Lincoln Land Wind funded in 2018, 2019 and continues to fund in 2020 the hard work of civic organizations, including the **Jacksonville Kiwanis** and **Franklin Lions Clubs**. By sponsoring events hosted by these organizations we provided for **youth activities** and community events like the **Franklin Burgoo** and **July 4 fireworks.**

- When you hear about the **Alzheimer Foundation**, you likely think of a national organization. We know that organization’s like these have a local arm which reaches families dealing with the challenges presented by diseases like Alzheimers. That is why we were proud to sponsor the **Jacksonville Walk to End Alzheimers in 2019 and are again sponsoring the 2020 walk.**

- No Morgan County event is more excitedly anticipated than the **Morgan County Fair** and we have been proud sponsors since coming to the area. But what the Lincoln Land Team has most enjoyed is participating in the **4-H auction**. In 2018 and 2019 each the Lincoln Land Wind project has enjoyed supporting the auction to buy animals which were raised by area youth and served to **showcase their skills in raising and showing farm animals.**

- Since 1948, the **Western Illinois Youth Camp** has provided outdoor experiences to the young and young at heart. It hosts day and overnight camps throughout the summer for school-aged children in Jacksonville and the surrounding area. WIYC also hosts Camp Courage, a weeklong overnight camp for persons with special needs. **The Lincoln Land team is proud to be a part of the effort to keep the camp thriving by providing a grant to improve the facilities.**

- **New Directions Warming & Cooling Center is an emergency homeless shelter for men, women, & children** that provides a safe place to stay, showers, laundry, and an evening meal to homeless members of the community. They receive no state or federal funding, but instead rely on support from local churches, businesses, and individuals. We are proud to support their work helping individuals and families regain their independence.

Morgan County is fortunate to have many residents who care deeply about the environment and resident’s access to nature. We are proud to have supported some of their efforts, including:

- The **Jacksonville Park Foundation** is pursuing its mission to promote recreation, physical activity, and community-wide health by supporting efforts to change the social and physical environment of the Jacksonville community by bringing together the resources of multiple community partners. We were glad to join in the effort by providing a grant for its **community garden initiative**.

- The **Friends of Sangamon Valley** has been preserving the Sangamon Valley's natural heritage by acquiring, restoring and protecting ecologically significant lands in the watershed. When they came to us with a project that would them to **finish a 25-acre plantings of the project and monitor the effects of the wetland bio-filtration removing nitrogen and other farm chemical runoff**, we said YES! and provided a grant to help fund the effort.

1.0 INTRODUCTION / PURPOSE

The Lincoln Land Wind Project (the "Facility") is a wind power generation project proposed by Lincoln Land Wind, LLC (the "Applicant"[1]) in Morgan County, Illinois. The Facility includes the construction of permanent facilities of 107 GE 127 meter rotor turbines with a 114 meter hub height, or 100 GE 140 meter rotor turbines with an 89 meter hub height, or 72 Vestas V150 turbines with a 105 meter hub height, or 63 Nordex N149 turbines with a 108 meter hub height, access roads, met towers, a substation, underground collection lines, and an operation and maintenance (O&M) facility. The capacities of the turbines are 2.82 MW, 3.03 MW, 4.2 MW and 4.8 MW respectively for a project capacity of 302 MW. The decommissioning cost vary with the number of turbines, length of access roads, length of collection system, length of crane paths, and other quantities, so pricing was developed for all four options.

The purpose of this "Decommissioning Plan" (and its succeeding and revised Decommissioning Plans, (the "Plans") is to describe the means and methods that can be used to remove project facilities, and reclaim, restore, and return the land altered during the construction and operation of the wind project to its predevelopment condition to the extent feasible. The Plans identify components which may be removed, and the areas that may be restored once the Facility has been abandoned, not operated for twelve consecutive months, or when the Facility has surpassed the useful lifespan of the turbines and facilities. This includes the disrepair of individual turbines which may pose a health or safety issues. The useful life of commercial size turbines is generally considered to be 30 years.

Applicant acknowledges that decommissioning is accomplished at Applicant's (and its successors-in-interest and assigns) expense. Applicant also commits that if Applicant does not complete decommissioning within the time specified, Morgan County may take action as necessary to complete decommissioning, including drawing on the financial assurance.

The Decommissioning Plan will be updated and re-filed with the Morgan County Board every five years after the initial ten (10) years of operation. The revised plans will reflect advancements in construction techniques, reclamation equipment, and standards. The decommissioning cost estimate will also be revised every five years to reflect the changes in the costs.

2.0 PROPOSED FUTURE LAND USE

Prior to the development of the Facility, the land use in the areas affected by development was primarily agricultural land planted with row crops. After affected areas are decommissioned, these areas will be returned to their predevelopment condition.

3.0 ENGINEERING TECHNIQUES

Decommissioning includes several phases and activities such as:

- Preparation of crane paths to accommodate movement of large industrial cranes to and from each turbine location;
- Preparation of crane pads for removal of turbine components;

[1] As set forth in the Morgan County, Illinois Wind Energy Conversion Systems Siting Regulations Ordinance (Ordinance 2019-10 (the "Ordinance"), "Applicant" means the entity who submits to Morgan County, pursuant to Article V (Siting Approval Permit Application) of this Ordinance, an application for siting and operation of any WECS or Substation. All references to Applicant in this Ordinance shall include Applicant's successors-in-interest and assigns, which includes a WECS Permittee..

- Removal of above ground components (turbines, transformers, met towers, substation, and possibly the operation and maintenance facility);
- Removal of turbine, transformer, met tower, substation, and O&M building foundations to a depth of five (5) feet;
- Removal of underground collection system and fiber optic cables to a depth of five (5) feet;
- Removal of access roads (unless the landowners request the roads to remain) and crane paths;
- Restoration of crane paths and access roads, including decompaction;
- Reclamation, re-grading, and restoration of disturbed areas including top soil reapplication and decompaction of soils;
- Application of necessary sediment and erosion controls during and following decommissioning; and
- Repair of public roads and culverts to pre-decommissioning condition.

During decommissioning, participating landowners will be consulted to determine the scope and extent of reclamation work to be completed. Some Facility infrastructure such as the access roads may be left in place at the landowner's requests. Underground utility lines deeper than five (5) feet below ground may be left in place to minimize land disturbance and associated impacts to future agricultural land use.

Decommissioning will include the removal and transportation of all turbine components and debris from the Facility site. Decommissioning will also include the removal of cabling, electrical components, access roads, and any other associated facilities in the manner described in the Plan, unless otherwise agreed upon by Applicant and the applicable landowner. All dismantling, removal, recycling, and disposal of materials generated during decommissioning will comply with rules, regulations, and prevailing laws at the time decommissioning is initiated, and will use approved local or regional disposal or recycling sites as available. Recyclable materials will be recycled to the furthest extent practicable. Non-recyclable materials will be disposed of in accordance with state and federal law.

There are no known hazardous materials contemplated for incorporation in the Facility with the exception of certain oils and fluids described in the section on the O&M facility. During decommissioning the then current regulations for identifying, handling, and disposing of hazardous materials will be followed.

3.1 DECOMMISSIONING

Public Road Modifications and Removal

Temporary turning radius modifications are not expected be needed for decommissioning as turbines that have reached the end of useful life have scrap value, but little resale value. Transportation of the turbine components off-site will be accomplished using conventional over the road trucks. Following removal of the decommissioned turbine components, any turning radius modifications required for decommissioning will be removed and any disturbed areas will be restored to preconstruction condition using thorough decompaction techniques and re-application of topsoil. After all hauling activities are complete the public roads will be restored to pre-decommissioning condition, or a payment for road life consumed will be made.

Crane Path Preparation and Removal

To facilitate the movement of the large industrial cranes used to disassemble the turbines, crane paths will be required between the turbine sites. A crane path network was designed for the construction of the wind project. The same corridors are likely to be used for decommissioning. Some turbine access roads may be temporarily widened from their operational width of 16 feet to approximately 36 feet wide, by compacting in place soils to create crane shoulders on roads that were configured to accommodate crane travel during the construction of the Facility. Preparations include compaction of the native soils, construction of temporary road crossings, and construction of crane mat crossings, low water crossings, and/or temporary culverts to cross streams. Following disassembly of the wind turbines, the temporary crossings will be removed and the crossing areas will be restored to pre-decommissioning conditions. The soil on the crane paths will be decompacted and restored to a tillable condition.

Crane Pad Preparation, Removal, and Restoration

A 40 foot by 80 foot crane pad will be prepared at each turbine location to be used during dismantling of the turbines. Temporary alteration of turbine pads may be necessary to facilitate crane movements during decommissioning of above-ground turbine components. If such alteration is necessary, topsoil from the additional disturbed areas will be stripped and isolated, for re-application after turbines have been dismantled and crane pads removed. After removal of all turbine components, the crane pad area will be removed by excavating any granular materials placed during the initial construction of the crane pad. Disturbed areas will be restored to pre-construction condition by re-grading the area, reapplying topsoil, and de-compacting the subsoil and topsoil. See section 3.2 for additional information on reclamation and restoration.

Wind Turbine Removal

Each turbine consists of four (4) or five (5) steel tower segments, nacelle, rotor and hub assembly, and three blades. The turbine disassembly will be accomplished using large industrial cranes. If it is not cost effective to resell the turbines, the components will be processed on site into sizes which conform to scrap metal recycling requirements. The materials can then be sold for scrap material value and recycled. The tower sections, in particular, represent a substantial amount of high quality steel materials. The processed scrap materials will be loaded on tractor-trailers and removed from the site to a prearranged receiving location, or directly to a recycling or disposal facility. If the components are resold, the individual components will be loaded onto turbine transport vehicles similar to the vehicles originally used to deliver the turbine parts.

Turbine Foundation Removal and Restoration

Turbine foundations are fabricated of concrete and rebar. Topsoil and aggregate from the area surrounding the foundations will be stripped, segregated, and stockpiled near the work site for to reapplication during restoration. The turbine foundation will be exposed using backhoes, bulldozers, or other earth moving equipment. The pedestal (upper part of the turbine foundation) will be removed to a depth of five (5) feet below the final ground surface. Demolition of mass concrete is generally accomplished using hydraulic hammers mounted on a backhoe or similar equipment (hoe ram), or by the use of expansive chemicals placed in holes drilled in the concrete. Concrete and rebar will be broken into manageable-sized pieces and loaded into dump trucks to be hauled off site for recycling as aggregate or disposal.

Following the removal of turbines and foundation pedestals, the resulting voids will be backfilled with clean native subsoils and compacted to a density similar to surrounding subsoils (typically approximately 90% of the fill material's standard Proctor density). Topsoil will then be reapplied to the site and graded to blend with the surrounding grade and preserve pre-existing drainage

patterns. The soil and topsoil will be decompacted to a minimum depth of 18 inches and restored to a tillable pre-construction condition, or re-seeded to promote re-vegetation. If necessary, the site will be temporarily or permanently re-vegetated, depending upon location, time of year, and anticipated post-decommissioning land use. Any drain tile lines damaged during removal and restoration of turbine foundation areas will be repaired to ensure drainage is maintained.

Access Road/Met Tower Road Removal and Restoration

Access roads will be removed or left in place based on the individual landowner's request. Removal of access roads will entail removal of the road base aggregate and any other materials used for constructing the roads. During removal, the topsoil adjacent to both sides of the roads will be stripped and stockpiled in a windrow paralleling the road. The road base materials will then be removed by bulldozers and wheeled loaders, or backhoes, and hauled off site in dump trucks to be recycled or disposed at an off-site facility. On site processing may allow much of the aggregate to be re-used to improve public roads. The decommissioning contractor will also likely seek disposal opportunities for clean fill from nearby landowners to reduce hauling and disposal costs. If geotextile fabric was utilized under the aggregate base, it will be removed and disposed of in a landfill off-site. The access road removal will proceed from the turbine area to the public roads to limit tracking and provide a stable access during removal. Following removal, topsoil will be reapplied and graded to blend with surrounding contours to promote pre-construction drainage patterns. Topsoil to cover the access roads, turbine rings, and met tower rings will be acquired from the areas where it was stockpiled (or wasted) during the original construction. Since topsoil stayed with each landowner in the construction of the wind farm there will be adequate topsoil to restore each area to its pre-construction condition. The soil and topsoil will then be decompacted to a minimum depth of 18 inches and restored to pre-construction tillable condition or re-vegetated.

Underground Electrical Collection Lines

The electrical cables and fiber optic conduits are installed at a depth of a minimum of 4 feet (by plan), and contain no material known to be harmful to the environment. The only exception is cables entering ground mounted transformers and junction boxes. Accordingly, the majority of underground cables will be left in place, non-functional. Any cable at a depth of less than five (5) feet will be removed. Following cable, junction box, and route marker removals, disturbed areas will be restored by the restoration methods described above for access roads, including the reapplication of topsoil to match the surrounding grade and preserve or promote pre-existing drainage patterns. Soil and topsoil will be decompacted to a minimum depth of 18 inches.

Overhead Electrical Collection Lines

The Project substation is located adjacent to an existing transmission line, resulting in a short (single span) overhead transmission line. All poles, conductors, switches and lines associated with this interconnection link will be removed and hauled off site to a recycling facility or disposal site. Pole foundation holes will be filled with a suitable clean compactable material. Topsoil will be applied and the areas and re-vegetated to a pre-construction condition. The interconnection substation will be owned by transmission line owner so the scope of the interconnect facility decommissioning is not included with the Wind Farm.

Substation

All steel framing, conductors, switch gear, transformers, security fence and other components of the step-up facility will be disassembled and recycled or reused off-site. Foundations and underground components will be removed to a depth of five (5) feet. The rock base will be removed using bulldozers and wheeled loaders or backhoes. The material will be hauled from the site using dump trucks to be recycled or disposed at an off-site facility. Permanent storm water treatment facilities, such as retention basins, will be removed. Topsoil will be reapplied to blend with the surrounding grade to promote pre-construction drainage patterns. Soil and topsoil will be decompacted to a minimum depth of 18 inches and the site will be restored to the pre-construction tillable condition or re-vegetated.

Operations and Maintenance Facility

The Lincoln Land wind project may rent an existing building, or construct a new building for its O&M building. If the building is leased, possession will be returned to the owner at the end of the project.

Hydraulic oil and lubricants will be stored in the building during operation of the wind project. The project will have a Spill Prevention Control and Countermeasure plan in place during operations that will require immediate clean-up of any spilled hazardous materials, so the cleanup of any hazardous materials is an operating cost and not a decommissioning cost.

The O&M facility, if constructed will likely be a sturdy, general purpose, steel building. Buildings have a longer useful life than wind turbines so the building will not likely be at the end of its useful life when the Facility is decommissioned. Decommissioning will consist either of the sale of the building, the donation of the facility, or the demolition and removal of the structure, foundation, and rock base parking lot and associated storm water treatment facilities. If demolition is undertaken, all associated materials, concrete and rock will be removed from site using backhoes and bulldozers, and hauled off site in dump trucks. All materials which are able to be recycled will be brought to an approved facility. The remaining materials will be disposed of at an approved landfill. Topsoil will be reapplied to the site and graded to blend with the surrounding grade to promote existing drainage patterns. The topsoil will be decompacted to a minimum depth of 18 inches and restored to a pre-construction tillable condition or re-vegetated.

3.2 RECLAMATION

In addition to the reclamation activities described above for each decommissioning activity, all unexcavated areas compacted by equipment and activity during the decommissioning will be decompacted to a depth of 18 inches or to a depth as needed to ensure proper density of topsoil consistent and compatible with the surrounding area and associated land use. All materials and debris associated with the Facility decommissioning will be removed and properly recycled or disposed of at off-site facilities.

As necessary, the topsoil will be stripped and isolated prior to removal of structures and facilities for reapplication to promote future land use activities. The topsoil will be reapplied following backfill, as necessary, and graded to blend with adjacent contours to maintain pre-construction drainage patterns. The topsoil reapplied will be free from rocks larger than four inches and will not contain debris from decommissioning. Decompaction of the soil and topsoil will be done to a minimum depth of 18 inches. If the area is not going to be used for crops, the topsoil will then be re-vegetated using seed mixes approved by the local Farm Service Agency, Soil and Water Conservation District, or Natural Resource Conservation Service. Temporary erosion protection such as mulch, hydromulch or erosion control blanket will be applied in accordance with the requirements of the project Storm Water Pollution Prevention Plan (SWPPP).

4.0 BEST MANAGEMENT PRACTICES (BMPs)

During decommissioning, erosion and sediment control BMPs will be implemented to minimize potential for sedimentation of surface waters and waters of the state. Because decommissioning will entail disturbance to more than one acre of soil, Applicant will prepare a Storm Water Pollution Prevention Plan (SWPPP) and process a National Pollutant Discharge Elimination System (NPDES) permit prior to initiating soil disturbing activities. Potential BMPs are described below are examples which will be subject to refinement in the SWPPP. The decommissioning team will review the permitting requirements at the time of decommissioning, and obtain any other necessary permits, which may include a U.S. Army Corps of Engineers Section 404 Permit to Discharge Dredged or Fill Material. Because virtually all of the project area is currently used to raise crops exposed soil is a common condition and only minor erosion and sediment control is expected.

4.1 EROSION CONTROL

Erosion control measures are described generally here, but will be refined based on the standard of practice current at the time the SWPPP is developed for decommissioning. All disturbed areas without permanent impermeable or gravel surfaces, or planned for use as crop land, will be vegetated for final stabilization. All slopes steeper than 4:1 should be protected with erosion control blankets. Restoration should include seed application prior to application of the blanket. All slopes 4:1 or flatter should be restored with seed and mulch, which will be disc anchored.

Project Phasing/Design BMP: Time periods during which disturbed soils are exposed should be minimized the degree possible. Stabilization of soils will generally be accomplished immediately following decommissioning of the access roads, turbine sites, electrical and fiber optic cables, step-up substation, and O&M facilities. Where this is not possible, temporarily exposed soils will be temporarily stabilized with vegetation in accordance with the SWPPP for decommissioning.

Erosion Control Blankets and Seed BMP: Erosion control blanket (double sided netting with wood fiber or weed-free straw fiber blanket) will be used as temporary stabilization for areas of slopes steeper than 4:1 and for areas of concentrated flow, such as ditches, swales, and similar areas around culverts. Seed will be applied in these areas with the blanket for temporary and/or permanent vegetative growth as necessary. The SWPPP developed for decommissioning will provide detailed specifications for erosion control blankets to be used under various slope and drainage conditions.

Ditch/Channel Protection: Where new channels are formed, as in the case of culverts removed from access roads and the removal of low water crossings, the resulting channel will be protected with erosion control blankets as described in the section above.

Surface Roughening: Surface roughening or slope tracking is the act of running a dozer or other heavy tracked equipment perpendicular to the grade of disturbed slopes with a grade of 3H:1V and steeper with a continuous length of 75 feet or greater. The tracks will provide a rough surface to decrease erosion potential during an interim period until a smooth grade, seed and erosion control blanket can be applied.

Temporary Mulch Cover and Seed BMP: Temporary mulch cover (wood fiber to resist loss from grazing by wildlife or domestic animals) will be applied at a rate of two tons per acre to provide temporary erosion protection of exposed soils areas with slopes flatter than or equal to 3:1. Seed will be applied with the mulch for temporary and/or permanent vegetative growth as called for in the SWPPP. Mulch will be used for all soil types where slopes are flatter than 3:1

and no significant concentrated flows are present. The mulch will be disc-anchored to the soil to keep it from blowing away. The mulch prohibits the impact of the rain drop from dislodging soil and subsequently carrying the soil away during sheet drainage. In sandy soils tackifier may be used to assist the disc anchoring if the mulch cannot be secured to the sandy soils.

Soil Stockpiles: Topsoil that is stripped from the construction site and base materials will be stockpiled on site. Stockpile areas will be located in areas that will not interfere with the decommissioning activities, and be located away from pavement, site drainage routes, or other areas of concentrated flow. Stockpiles should also be located away from wetlands and surface waters. Perimeter controls, such as silt fence, will be installed around all stockpiles if stockpiles are not placed within existing silt fences or other sediment control, where the potential exists for material to be eroded and transported to sensitive nature resources. Soils that are stockpiled for longer durations will be temporarily seeded and mulched, or stabilized with a bonded fiber polymer emulsion.

Permanent seed and temporary mulch and/or erosion control blanket BMP: In areas at final grade that will not be used for agriculture, permanent seed will be applied to promote vegetative cover for permanent erosion control. Temporary mulch and/or erosion control blanket will be applied as appropriate in areas to provide temporary erosion protection until the permanent seed is established.

4.2 SEDIMENT CONTROL

Removal of Ditch Crossing BMP: Temporary ditch crossings may be needed to accommodate the movements of cranes or other heavy equipment. Perimeter controls such as silt fence will be used at crossing locations to minimize runoff from exposed soils. Crossings will be done during dry conditions, if possible. If a stream is wet at the time of the crossing, alternative BMPs will be applied. These could include a temporary dam and bypass pump to install the crossing in dry conditions. Timber construction mats will be used as needed to prevent compaction and rutting at crossing locations. All temporary fills and construction mats will be removed immediately after the crossing is successfully completed and the temporarily disturbed area restored using the appropriate BMPs as described above.

Dewatering: A temporary sump and rock base will be used if a temporary pump is used to dewater an area of accumulated water. If a rock base cannot be used, the pump intake will be elevated to draw water from the top of the water column to avoid the intake and discharge of turbid water. Energy dissipation riprap will be applied to the discharge area of the pump hose. The water will be discharged to a large flat vegetated area for filtration/infiltration prior to draining into receiving waters of conveyances/ditches. If discharge water is unavoidably turbid, dewatering bags, temporary traps, rock weepers, or other adequate BMP will be used to control sediment discharge.

Silt Fence BMP or Fiber Logs: Silt fences or fiber logs will be used as perimeter controls downgradient of exposed soils during construction to capture suspended sediment particles on site, to extent possible. The standard silt fence or fiber logs will also be used in smaller watershed areas where the contributing areas are typically less than 1/4 acre of drainage per 100 feet of standard silt fence or the fiber logs. Standard silt fence or fiber logs will also be used for stockpiles 8 feet high or higher which have slopes of 3:1 or steeper. Standard silt fence or fiber logs should not be used in areas of highly erodible soils which are found within streams, slopes, or banks of creeks and streams within the Facility's site.

Rock Entrance/Exit Tracking Control BMP: Rock construction entrances will be installed where access to a construction area is needed from adjacent paved surfaces.

Street Scraping/Sweeping BMP: Street scraping and sweeping will be used to retrieve sediment tracked or washed onto paved surfaces at the end of each working day, or as needed.

4.3 CONTROLLING STORMWATER FLOWING ONTO AND THROUGH THE PROJECT

Given the low gradient of the slopes in the project area, controlling stormwater flow that enters the project area will likely require minimal effort during decommissioning activities. Only newly disturbed areas may require new, temporary stormwater control.

Diversion Berms/Swales/Ditches: It may be necessary to direct diverted flow toward temporary settling basins via berms, swales, or ditches. If diversion controls are deemed necessary for decommissioning activities, these must be stabilized by temporary mulch and seeding, erosion control blankets, or by installing riprap to protect the channel from erosive forces.

Rock Check Dams: It may be necessary to install temporary check dams within swales or ditches that convey storm water from areas disturbed by decommissioning activities. Rock check dams are effective for velocity control, sediment control, and to augment temporary stabilization of channels. Filter fabric can be utilized to help filter the flow, minimize the scour of the soil under the rock, and facilitate removal of the check dams once permanent stabilization is achieved. The height of check dams should be at least two feet. Spacing depends upon slope. Downgradient rock checks should have the top elevation at the same elevation as the bottom of the previous (upgradient) rock check.

Hay Bale Check Dams: Hay bale check dams may be used for velocity control within swales of the project to slow the water runoff within the drainage channels/swales. The bales should be approximately three feet in length and anchored into the soil. The midpoint elevation of the top of the bale (i.e. ponding height) must be lower than the end points of the bale where the bale meets grade, to prohibit water from flowing around the bales thus causing erosion and scour. If the bales cannot be applied properly in the field, the use of rock checks as a replacement is recommended.

Temporary Sedimentation Basins: Sedimentation basins serve to remove sediment from runoff from disturbed areas of the site. The basins allow runoff to be detained long enough to allow the majority of the sediment to settle out prior to discharge. The location and dimensions of temporary sedimentation basins, if any are necessary, will be verified in accordance with Illinois Department of Natural resources (IDNR) requirements at the time of decommissioning.

4.4 PERMITTING

All decommissioning and restoration activities will comply with federal and state permit requirements. Decommissioning activities that will disturb more than one acre of soil may trigger the NPDES Construction General permitting process and Illinois general permit or Notice of Intent. The permits, if required, will be applied for and received prior to decommissioning construction activities commencing. A Storm Water Pollution Prevention Plan will be developed prior to filing a Notice of Intent. If permanent crossings are to be removed and no discharge of dredged or fill material will take place, then a Section 404 permit is not anticipated for the decommissioning of the Facility. No air permits are currently required for construction activities typical for decommissioning. Illinois Environmental Protection Agency (IEPA) air quality rules will be reviewed at the time the work is scheduled to determine if an air quality permit will be

required. Further, no operating air quality permits are needed for ongoing operation of the wind farm facility. Should decommissioning activities cause temporary or permanent impacts to wetlands, an Illinois Department of Natural Resources (IDNR) Wetlands Permit will be obtained prior to any activities commencing, if required. Should decommissioning activities cause temporary or permanent impacts to vernal pools, an Army Corps of Engineers General Permit for the State of Illinois will be obtained prior to any activities commencing. Should any interim permits become needed, they will be closed out with documentation of compliance at decommissioning. A Spill Prevention, Control and Countermeasures (SPCC) Plan for decommissioning, separate from the operating SPCC will likely be required.

5.0 TIMELINE

Decommissioning of the wind farm will be initiated if the project has not produced electricity for a period of one (1) year unless other mitigating circumstances prevail. The following sections outline a timetable for the decommissioning plan; steps towards compliance with applicable air and water quality laws and regulations; and steps for compliance with health and safety standards.

5.1 DECOMMISSIONING SCHEDULE

It is anticipated that the decommissioning activities for the project can be completed in an eight (8) month period. See Figure 1 for a representative schedule. The estimated costs for decommissioning are tied to assumptions about the amount of equipment mobilized, the crew sizes, weather and climate conditions, and the productivity of the equipment and crews. No utility sized wind farm has been decommissioned to date so there are no historical activity durations available for some of the activities that can be applied directly.

5.2 WATER REGULATORY COMPLIANCE

Water Quality: NPDES permitting will include the following steps for compliance.

1. Complete a SWPPP consistent with the requirements of the Illinois NPDES General Construction Permit applicable at the time of decommissioning.
2. Submit the NPDES Notice of Intent at least 30 days prior to starting construction activities associated with decommissioning.
3. Once notification of permit coverage is received, decommissioning will commence.
4. During decommissioning, compliance with the NPDES permit (applicable at the time of decommissioning) will be adhered to including inspections, documentation, maintenance of BMPs, record keeping, amendments to the Plans and implementation of the SWPPP.
5. Within 30 days of completing decommissioning and restoration, a Notice of Termination (NOT) will be submitted to Illinois Environmental Protection Agency to terminate coverage of the NPDES permit.

Water Quality: Section 404 Discharge of dredged and fill material, if required, will include the following steps for compliance.

1. Notification to the Corps of Engineers if needed, of expected activities such as temporary stream/water body crossings.
2. Verification of necessary permits (if any).
3. Apply for any necessary Section 404 permits prior to commencing work within waterways/ wetlands.
4. As applicable, develop Plans to comply with necessary permit regulations.

5. Once receipt of applicable permits, decommissioning work will commence adhering to rules, timelines and requirements stated in applicable permits.

5.3 HEALTH AND SAFETY STANDARDS

Work will be conducted in strict accordance with Applicant's health and safety plan. The construction contractor hired to perform the decommissioning will also be required to prepare a site-specific health and safety plan. All site workers, including subcontractors, will be required to read, understand, and abide by the Plans. A site safety office will be designated by the construction contractor to ensure compliance. This official will have stop-work authority over all activities on the site should unsafe conditions or lapses in the safety plan be observed.

6.0 DECOMMISSIONING COSTS AND FINANCIAL ASSURANCE

Since there are no utility sized wind farms that have been decommissioned to date, there are no historical costs available to base this estimate on. This cost estimate was prepared: (1) in current dollars; (2) with the salvage value of equipment or materials calculated separately. The estimate includes: (i) an analysis of the physical activities necessary to implement the approved reclamation plan, with physical construction and demolition costs based on applicable Illinois Department of Transportation unit bid prices and RS Means material and labor cost indices; (ii) the level of effort or number of crews required to perform each of the activities; and (iii) an amount to cover contingencies above the calculated cost. The Estimate is shown on a total cost and on a per-turbine basis. The decommissioning plan and cost estimate will be revised periodically.

Cost and quantities shown are preliminary for the Lincoln Land Wind Project, as design is not complete at the time this estimate was prepared. Since this estimate is intended to cover the first ten years of wind farm operation it can be assumed that there will be some resale value for the turbines. Analyses done on recent project indicate that current resale prices are in the range of $100,000 per MW, but that the current market does not support the resale of as many turbines as are planned for the Facility. To be conservative, no estimate of resale value was made.

Turbines that are not resold will have the materials recycled as scrap. The estimate uses a current structural scrap price of $240 per ton, in the Midwest, based on prices posted on http://www.scrapmonster.com/scrap-prices/category/Steel/300/1/1, on December 10, 2019. The posted prices are three months old. Scrap metal prices are very volatile. Current prices are approximately 50 percent of the peak prices in 2008. Electrical transformer have significant value for aluminum or copper used in the windings and the steel used in other parts of the transformer. Newer transformers can be resold. Older transformers are recycled as scrap. There are few companies that accept used transformers for resale or recycling so finding pricing is difficult. For this estimate we used pricing posted scrapmonster.com of $0.37 per pound for used transformers. We assumed the posted price is similar to the price offered by Addco Services in Tinley Park, Illinois which was identified as a regional transformer recycler. In this first cycle of cost estimating it may be possible to resell all of the transformers at a much higher price than the scrap value used.

Spot prices for insulated copper wire (85% recovery) are $1.58 per pound, scrap electrical motors are $0.24 per pound, and E.C. aluminum wire are $0.79 per pound.

Discounts from the posted spot prices ranging from twenty-five percent (25%) for structural steel to fifty percent (50%) for aluminum wire have been used to reflect the difficultly in realizing spot prices from local recyclers.

The form of financial assurance is a financial instrument mutually agreed upon by Morgan Board of County Commissioners and Applicant, and will be adjusted upward or downward to offset any increases or decreases in decommissioning costs and salvage values determined during periodic Plans updates. If decommissioning of the Facility or individual turbines is undertaken, Applicant will, upon satisfactory completion, provide supporting documentation to the Morgan County Board with a request for the release of the posted funds or financial assurance.

The Applicant grants the Morgan County Board the right of entry to the Facility and the right to sell and transfer recycled material to salvage firms in the event of default by the Applicant.

The total cost of the decommissioning of the Lincoln Land Wind Project for the most expensive option (see Table 1) is approximately $18,116,000 ($169,000 per turbine) including a ten percent (10%) contingency on the demolition costs and engineering/administration costs and crop lop loss. Salvage/scrap value of the turbines, transformers, and other materials is approximately $6,100,000, or $57,000 per turbine. Including resale and salvage values the net cost is approximately $12,000,000, or $112,400 per turbine for Option 1, 107 GE 127m turbines.

The Cost Estimate for Option 2, 99 GE 140m turbines, is shown in Table 2, and is equal to approximately $10,200,000.

The Cost Estimate for Option 3, 72 Vestas V150m turbines, is shown in Table 3, and is equal to approximately $8,000,000.

The Cost Estimate for Option 4, 63 Nordex N149m turbines, is shown in Table 4, and is equal to approximately $6,800,000.

Cost Estimates next page.

Table 1: Cost Estimate Option 1 – 107 GE 127m Turbines

Lincoln Land Wind Project - DECOMMISSIONING COST ESTIMATE	
General Conditions (Field Staff Cost)	$753,000
Operation & Maintenance Building (Demolition and Removal)	$0
Substations (Dismantle and Removal)	$168,627
Met Tower (Dismantle and Removal)	$25,318
Access Road Removal (Remove Agg./Regrade)	$1,840,213
Crane Path Restoration (Water Crossing Removals and Decompaction)	$67,263
Crane Mobilization (2, Mobilization and Demobilization)	$400,000
Turbine Tower Dismantle and Salvage Prep (Dismantle/Salvaging)	$5,153,247
Transformer Removal	$264,076
Blade Disposal (Dismantle/Disposal)	$925,541
Turbine Foundation Removal (48 inches Demolition/Removal)	$2,173,399
Electrical Collection/Transmission Line Removal	$45,381
Erosion and Sediment Control BMP's	$160,438
Site Restoration (Final Surfacing following Removals)	$1,033,404
Public Road Restoration	$2,664,473
Subtotal	$15,674,380
Contingency (10%)	$1,567,438
Total Estimated Decommissioning Cost (not including salvaged value)	$17,241,818
Total Estimated Decommissioning Cost per Turbine (not including salvage value)	$161,138
County Administration Costs (2.5%)	$431,000
Crop Loss	$443,200
Total Cost	$18,116,018
Total Salvage Value for Project	$6,094,305
Resale and Salvage Value per Turbine (107 Turbines)	$56,956
Total Estimated Decommissioning Cost (including salvaged value)	$12,021,713
Total Net Decommissioning Cost Per Turbine Minus Salvage Value	$112,352

Table 2: Cost Estimate Option 2 – 99 GE 140m Turbines

Lincoln Land Wind Project - DECOMMISSIONING COST ESTIMATE	
General Conditions (Field Staff Cost)	$670,000
Operation & Maintenance Building (Demolition and Removal)	$0
Substations (Dismantle and Removal)	$168,627
Met Tower (Dismantle and Removal)	$25,318
Access Road Removal (Remove Agg./Regrade)	$1,703,898
Crane Path Restoration (Water Crossing Removals and Decompaction)	$62,763
Crane Mobilization (2, Mobilization and Demobilization)	$400,000
Turbine Tower Dismantle and Salvage Prep (Dismantle/Salvaging)	$4,286,302
Transformer Removal	$244,332
Blade Disposal (Dismantle/Disposal)	$781,050
Turbine Foundation Removal (48 inches Demolition/Removal)	$2,010,902
Electrical Collection/Transmission Line Removal	$41,175
Erosion and Sediment Control BMP's	$141,033
Site Restoration (Final Surfacing following Removals)	$923,248
Public Road Restoration	$2,465,260
Subtotal	$13,923,909
Contingency (10%)	$1,392,391
Total Estimated Decommissioning Cost (not including salvaged value)	$15,316,300
Total Estimated Decommissioning Cost per Turbine (not including salvage value)	$154,710
County Administration Costs (2.5%)	$383,000
Crop Loss	$386,800
Total Cost	$16,086,100
Total Salvage Value for Project	$5,847,277
Resale and Salvage Value per Turbine (99 Turbines)	$59,063
Total Estimated Decommissioning Cost (including salvaged value)	$10,238,824
Total Net Decommissioning Cost Per Turbine Minus Salvage Value	$103,422

Table 3: Cost Estimate Option 3 – 72 Vestas V150m Turbines

Lincoln Land Wind Project - DECOMMISSIONING COST ESTIMATE	
General Conditions (Field Staff Cost)	$569,000
Operation & Maintenance Building (Demolition and Removal)	$0
Substations (Dismantle and Removal)	$168,627
Met Tower (Dismantle and Removal)	$25,318
Access Road Removal (Remove Agg./Regrade)	$1,243,835
Crane Path Restoration (Water Crossing Removals and Decompaction)	$50,156
Crane Mobilization (2, Mobilization and Demobilization)	$400,000
Turbine Tower Dismantle and Salvage Prep (Dismantle/Salvaging)	$4,411,631
Transformer Removal	$177,696
Blade Disposal (Dismantle/Disposal)	$801,938
Turbine Foundation Removal (48 inches Demolition/Removal)	$1,462,474
Electrical Collection/Transmission Line Removal	$30,355
Erosion and Sediment Control BMP's	$84,470
Site Restoration (Final Surfacing following Removals)	$592,205
Public Road Restoration	$1,792,917
Subtotal	$11,810,622
Contingency (10%)	$1,181,062
Total Estimated Decommissioning Cost (not including salvaged value)	$12,991,684
Total Estimated Decommissioning Cost per Turbine (not including salvage value)	$180,440
County Administration Costs (2.5%)	$325,000
Crop Loss	$224,200
Total Cost	$13,540,884
Total Salvage Value for Project	$5,497,029
Resale and Salvage Value per Turbine (72 Turbines)	$76,348
Total Estimated Decommissioning Cost (including salvaged value)	$8,043,855
Total Net Decommissioning Cost Per Turbine Minus Salvage Value	$111,720

Table 4: Cost Estimate Option 4 – 63 Nordex N149m Turbines

Lincoln Land Wind Project - DECOMMISSIONING COST ESTIMATE	
General Conditions (Field Staff Cost)	$532,000
Operation & Maintenance Building (Demolition and Removal)	$0
Substations (Dismantle and Removal)	$168,627
Met Tower (Dismantle and Removal)	$25,318
Access Road Removal (Remove Agg./Regrade)	$1,090,480
Crane Path Restoration (Water Crossing Removals and Decompaction)	$50,563
Crane Mobilization (2, Mobilization and Demobilization)	$400,000
Turbine Tower Dismantle and Salvage Prep (Dismantle/Salvaging)	$4,312,054
Transformer Removal	$155,484
Blade Disposal (Dismantle/Disposal)	$785,342
Turbine Foundation Removal (48 inches Demolition/Removal)	$1,279,665
Electrical Collection/Transmission Line Removal	$26,748
Erosion and Sediment Control BMP's	$81,567
Site Restoration (Final Surfacing following Removals)	$554,623
Public Road Restoration	$1,568,802
Subtotal	$11,031,273
Contingency (10%)	$1,103,127
Total Estimated Decommissioning Cost (not including salvaged value)	$12,134,400
Total Estimated Decommissioning Cost per Turbine (not including salvage value)	$192,610
County Administration Costs (2.5%)	$303,000
Crop Loss	$219,600
Total Cost	$12,657,000
Total Salvage Value for Project	$5,879,307
Resale and Salvage Value per Turbine (72 Turbines)	$93,322
Total Estimated Decommissioning Cost (including salvaged value)	$6,777,694
Total Net Decommissioning Cost Per Turbine Minus Salvage Value	$107,582

Re: Lincoln Land Project: Morgan County, IL

Dear Mr. Evans:

In response to your request on November 18, 2019, the National Telecommunications and Information Administration provided to the federal agencies represented in the Interdepartment Radio Advisory Committee (IRAC) the plans for the Lincoln Land Wind Project, located in Morgan County, Illinois.

After a 45+ day period of review, of the reviewing federal agencies, none had concerns with turbine construction in the designated areas.

While the other IRAC agencies did not identify any concerns regarding radio frequency blockage, this does not eliminate the need for the wind energy facilities to meet any other requirements specified by law related to these agencies. For example, this review by the IRAC does not eliminate any need that may exist to coordinate with the Federal Aviation Administration concerning flight obstruction.

Thank you for the opportunity to review these proposals.

Sincerely,

John R. McFall

RE: Lincoln Land LLC Wind Farm, Morgan County
Endangered Species Consultation
EcoCAT Review #1808749

Dear Mr. Douglas:

This letter addresses consultation on this proposed action, a large wind energy generation facility, pursuant to the requirements of the *Illinois Endangered Species Protection Act* [520 ILCS 10/11], the *Illinois Natural Areas Preservation Act* [525 ILCS 30/17], and Title 17 *Illinois Administrative Code* Part 1075. Additionally, the Department may offer advice and recommendations for species covered under the *Fish & Aquatic Life Code* [515 ILCS 5, *et seq.*]; the *Illinois Wildlife Code* [520 ILCS 5, *et seq*.]; and the *Herptiles-Herps Act* [510 ILCS 69].

The proposed facility will generate several hundred megawatts of power from large utility-scale wind turbines. Turbines of this class usually approach or surpass five hundred feet in height and possess rotors with diameters exceeding 300 hundred feet. The environmental effects associated with turbines of this class may differ considerably from those in the 1.5-1.6 MW class which have been most common in Illinois in the past.

The facility will occupy a footprint in the eastern part of the County, extending from the Sangamon County Line west toward Jacksonville, lying on both sides of Interstate 72. Most of the area proposed for the facility is agricultural in character. It is drained by Mauvaise Terre Creek and the North Fork of Mauvaise Terre Creek.

The Department's role in the consultation process is to address potential adverse effects to Natural Areas and endangered species, and to fish and wildlife habitat more generally; this review is not intended to be the equivalent of the more comprehensive Environmental Assessment (EA) or Environmental Impact Statement (EIS) produced for compliance with the *National Environmental Policy Act* (NEPA), documents which are required only for actions

undertaken, authorized, or funded by the federal government. The Department does not consider, and does not state any opinions, related to other considerations common in zoning proceedings.

The products of this review are advisory recommendations which the County has the discretion to adopt, modify, or reject in accordance with the powers it possesses. The only exception is the case where going forward with the action would be certain to take endangered or threatened animals when, before the County could authorize the project, the applicant would be required to demonstrate it had received an Incidental Take Authorization from the Department of Natural Resources for that species. That circumstance is a possibility in this case.

Here are the Department's recommendations concerning this facility, followed by discussion of concerns which justify the recommendations.

Recommendation #1: The Department recommends the County consider imposing a requirement for the applicant to perform mist-net and acoustic bat surveys in wooded areas within or adjacent to the project area. Of particular interest are the bat populations of wooded habitats along the forks of Mauvaise Terre Creek.[1]

Recommendation #2: The Department recommends the County consider imposing a requirement for the applicant to curtail turbine operations below wind speeds of 5.0 meters per second during the period from July 15 through October 15 to conserve endangered, threatened, and non-listed bats. This measure will likely prevent the prohibited taking of endangered or threatened bats, and will reduce the mortality of non-listed bats by approximately fifty percent. While little of the project area is wooded, migrating bats will still be subject to significant mortality.

Recommendation #3: The Department recommends the County consider imposing a requirement to conduct three years of mortality monitoring from July 1 to October 15 to statistically quantify bird and bat mortality, by species, due to turbine operations.[2] If the County cannot do so, or chooses not to do so, the applicant should consider implementing such a program to demonstrate the level of mortality experienced and the species affected.

Recommendation #4: The Department recommends the County consider imposing a requirement for the applicant to conduct biological surveys for the presence of the State-listed threatened Lined Snake.

Discussion and supporting information for these recommendations is provided below.

Endangered or Threatened Plants

[1] Persons collecting, handling, or disposing of fish & wildlife taken from the wild are required to hold scientific collector permits from the IDNR pursuant to Title 17 Ill. Admin. Code Part 520 and Part 1070.
[2] See prior note.

The State-listed threatened **Virginia Bunchflower**, *Melanthium virginicum*, was reported in 1993 from a roadside ditch along Old Route 36, not quite one mile west of Alexander. This species prefers moist fertile soil in full sun. While more recent observations have not been reported, the species may still be present there.

While the construction of wind energy facilities often requires upgrading township roads, it is unlikely that Old Route 36 will need to be widened to accommodate facility construction traffic. The Department deems it unlikely that any individual plants of this species, if still present in that location, will be harmed in any manner by construction or operation of the project.

However, it is possible undocumented specimens may be present elsewhere within the project footprint. The *Illinois Endangered Species Protection Act* [520 ILCS 10/3] prohibits taking (i.e., "to harm in any manner") a State-listed plant, which is the property of the land owner, without securing the express written permission of the land owner, whomever that may be. It may be worthwhile for the petitioner to survey points where proposed private roads will intersect public roads to assure that this species is absent or that express written permission for taking has been secured.

Of course, the Department encourages conservation of the genetic material of any State-listed plant destroyed by construction, which may be accomplished by transplanting the root-ball or collecting or distributing seeds, again with the permission of respective land owners. The Department also encourages observers to report the locations of such plants to the Department for its records.

Birds

Much has been written about the effects of wind turbines on birds, with the result this issue has become a matter of concern to members of the public wherever wind energy facilities are proposed.

Experience in Illinois has shown that individual utility-scale wind turbines rarely kill more than six birds annually, with many killing none. Cumulatively, that amounts to thousands of individual birds annually[3], but because they are also distributed across hundreds of different species, these losses are not biologically significant, except for endangered or threatened species.[4]

Experience in Illinois has also failed to demonstrate that turbine siting has any discernable effect on avian mortality. Interested parties, including this Department, have been unable to predict with any accuracy the level of avian mortality, nor the avian species to which mortality occurs. Considering that Illinois is positioned to experience broad-front migration of most avian species,

[3] Approximately 2,700 commercial utility-scale wind turbines are operating in Illinois.

[4] The death of an endangered or threatened bird is always of legal significance, but the biological significance of a single mortality is less clear, varying across listed species; some losses are more crucial than others.

which birds will be killed and where they will die appear to be random events. Moreover, efforts to reduce mortality, such as painting rotor blades to be more visible to birds, have proven ineffective.[5] The Department knows of no effective means to reduce avian mortality.

Many wind energy facilities in Illinois have performed both pre-construction and post-construction surveys of avian use of project areas. Analysis of these results suggests that some species of birds will occur in much lower numbers, or not at all, following facility construction and operation. However, it is not that these birds are killed, but that they are displaced.

Because most birds are migratory, IDNR records only document breeding efforts (males calling on territory, nests, the presence of juveniles). No breeding of listed avian species has been reported to IDNR within the proposed boundaries of this facility within the last 25 years. That does not mean State-listed birds are not present.

The State-listed endangered **Upland Sandpiper**, *Bartramia longicauda*, was recorded in 1989, more than 25 years ago, in a field at the northwest corner of Loami Road and Orleans Road. Given the age of this record, the Department deems it unlikely this species is present there today, but this record is evidence that suitable habitat for this species is present in the project area.

Likewise, the State -listed endangered **Loggerhead Shrike**, *Lanius ludovicianus*, was observed nesting at the Jacksonville Links Golf Course in 1997. Although that record is within 25 years, the location is outside the project boundary. Yet, this record demonstrates this species may be present in suitable habitat in the vicinity.

Neither of these two species, although present within or near several wind energy facilities in Illinois, has been reported killed in this State by the construction or operation of wind turbines. The major threat to both appears to be during the construction phase, when undocumented nests may be destroyed when trees containing Shrike nests must be removed, or when Sandpiper nests on the ground are inadvertently destroyed by construction activity.

Documented deaths of State-listed birds due to wind turbines have been rare.[6] In September 2007, a juvenile **Osprey**, *Pandion haliaetus*, was injured while attempting to perch on a turbine nacelle in McLean County. This bird was treated and released the following day and continued its migratory movement. This remains the only reported incident involving wind turbines and Ospreys in Illinois.

[5] The rotor blade that kills a bird is invisible to the bird due to the blade's speed of motion, no matter its color or pattern.

[6] Information on avian mortality is typically gathered only where a wind energy facility is conducting mortality monitoring, and that usually ceases after two or three years of operation; some facilities conduct no mortality monitoring at all. Nevertheless, the Department believes sufficient monitoring has occurred at Illinois facilities to fairly characterize avian risk.

Other State-listed birds which have been reported as killed at Illinois wind turbines include the loss of a single endangered **Black Rail**, *Laterallus jamaicensis*, and four threatened **Black-Billed Cuckoos**, *Coccyzus erythropthalmus*. The latter bird illustrates the difficulty of anticipating mortality for a particular species.

The four Cuckoo losses occurred at two wind energy facilities located on opposite sides of the State; each facility reported one mortality in successive years, and each facility has since sought and received an Incidental Take Authorization[7] from the Department, since it appears such losses are likely to continue in these locations. However, these losses occurred at turbines located far from habitat suitable for this species, far from any records of breeding activity, and where no Cuckoos were observed during pre-construction assessments. By contrast, other State-listed bird species which were observed at and near these facilities (Upland Sandpiper; Loggerhead Shrike) were not killed or injured. Consequently, the Department cannot say with confidence that this facility will, or will not, kill any State-listed birds during its operation.

Wind energy generation facilities also directly adversely affect birds in non-lethal ways or indirectly, such as by exclusion from habitat, disruption of habitat, alteration of breeding behavior, or altering the behavior of prey or predators.

For example, the Department has noted that the State-listed **Northern Harrier**, *Circus cyaneus*, is often reported from pre-construction avian assessments for wind energy facilities, but is always absent from post-construction assessments. The Department speculates this species, which hunts by sound more than by sight, is prevented from locating prey within a wind facility due to the noise generated by wind turbines. Whether or not this is the reason, it is clear this species is excluded from the use of habitat occupied by wind turbines.

Another species similarly excluded is the non-listed **American Golden Plover**, *Pluvialis dominica*. Experience in Illinois and Indiana wind energy facilities has shown this species is excluded from habitat with one-quarter mile of a wind turbine, apparently due to an aversion to vertical structures and "breaks" in habitat (the species also avoids roads and buildings). Given the road, property line, and human habitation setbacks required under most wind turbine siting ordinances, this species is effectively excluded from all habitat within a wind generation facility. The cumulative effect of multiple wind facilities is of concern, because this arctic-bound species must spend several weeks on the ground in the Midwest as it molts into its arctic plumage, and not every open field provides suitable habitat.

Turbine noise, though slight to human ears, can be sufficient to interfere with bird songs essential to breeding success. Research on the effects of highway noise has demonstrated that males of some species nesting close to roads must alter the pitch of their songs to be heard, but that females remain more responsive to the original pitch, resulting in infidelity or a lack of

[7] Pursuant to the *Illinois Endangered Species Protection Act*, the Department may authorize taking that is otherwise prohibited which occurs due to a lawful activity, provided the taking will not jeopardize the survival or recovery of the species. 520 ILCS 10/5.5. These Authorizations were #139 and #140.

breeding success within 500 feet of busy highways. The same may be true for utility-scale wind turbines: a recent study in Kansas discovered that male Greater Prairie Chickens alter their mating calls in the presence of wind turbines.

The presence of turbines can alter the behavior of prey and predators. Whether due to motion, noise, or shadow-flicker, turbine operation may stress small mammals, resulting in a heightened state of alert which helps them avoid avian and mammalian predators. Because of avian and bat mortality due to blade collisions, some mammalian predators, such as **Coyotes**, *Canis latrans*, learn to scavenge beneath wind turbines for easy meals and take other prey as the opportunity arises. This was demonstrated at a wind energy facility in McLean County when Common Pheasants, *Phasianus colchicus,* were tallied as the most common bird "killed" in a turbine mortality study. Pheasants do not fly high enough to be struck by turbine blades but all feather-spots were attributed to the turbine. However, the more likely explanation is that these birds, attracted to the open study plots, were killed by scavenging coyotes. Coyotes have also been directly observed moving from turbine to turbine without foraging between them.

No nests of **Bald Eagles**, *Haliaeetus leucocephalus*, are known to be nearer the project area than the Illinois River. Although no longer listed as endangered or threatened, this species continues to be federally-protected under the *Bald and Golden Eagle Protection Act* (BGEPA). **Golden Eagles**, *Aquila chrysaetos*, do not breed or nest in Illinois but sometimes appear as a winter migrant as far south as St. Louis.

Accounts of Eagle fatalities due to wind turbines almost always involve the Golden Eagle; the mortality of Bald Eagles due to wind turbines is extremely rare, and none have been reported in Illinois. However, the Illinois population of Bald Eagles continues to expand at a rapid rate, and new pairs are colonizing sites, even in cities, which would have been avoided in the past. The Department believes the risk this facility poses to Bald Eagles is slight, but subject to change. The protection of Bald Eagles is a federal responsibility, and the applicant should discuss its proposal with the United States Fish & Wildlife Service.

Bats

Wind turbines take a far greater toll on bats than on birds. Utility-scale wind turbines in the 1.5/1.6 MW class in Central Illinois, when operated normally throughout the year, kill an average of 15 bats per year. Because modern turbines begin operations at lower wind speeds (3.0 meters per second) and have larger rotor diameters, they can be expected to kill higher numbers of bats unless measures are taken to reduce bat mortality.

The vast majority of bats killed by wind turbines belong to three non-listed species of migratory "tree" bats, so-called because they do not hibernate and migrate south for the winter. While proportions vary, it is not unusual for 90% or more of bats killed at an Illinois wind facility to be **Hoary Bats**, *Lasiurus cinereus*; **Silver-Haired Bats**, *Lasionycteris noctivagans*, and **Eastern Red Bats**, *Lasiurus borealis*. Losses for these long-lived species are so severe that experts are

estimating they will all be listed as endangered by mid-century even if no more turbines were built after 2014. Since wind energy facilities are expanding rapidly, conservation of these species will become increasingly important. (These bats do not suffer losses from White-Nose Syndrome, to which only cave-hibernating bats are exposed.)

The federally-listed and State-listed endangered or threatened bats whose range includes Morgan County belong to the *Myotis* genus: the endangered **Indiana Bat**, *Myotis sodalis*, and the threatened **Northern Long-Eared Bat**, *Myotis septentrionalis*. The range of a third species, the **Little Brown Bat**, *Myotis lucifugus*, also includes Morgan County. Maternity colonies of *Myotis* bats are documented in Morgan County only along the Illinois River, but this is likely due to a lack of search effort elsewhere in the County, rather than an absence of these species in suitable habitat, such as is found along the forks of Mauvaise Terre Creek within the project area. Data regarding the presence of bats in the project area is lacking.

These bats hibernate in mines and caves, where the White-Nose fungus is an ever-present threat. Two other cave-hibernating species may also be present: the **Tri-Color Bat**, *Perimyotis subflavus*; and the **Evening Bat**, *Nycticeius humeralis*. While these bats roost and forage generally near and above tree canopies, each species has been tallied as a wind turbine fatality in Illinois, though rarely.

The Little Brown Bat was once Illinois' most common species, followed closely by the Northern Long-Eared Bat, but these species have proven highly susceptible to White-Nose Syndrome, with annual mortality exceeding 90%. Once easily captured in surveys, they are now difficult to find. The Indiana Bat, by contrast, appears to have suffered only an approximate 20% reduction in population numbers due to this disease. The US Fish & Wildlife Service is studying whether to list the Little Brown Bat and, on December 20, 2017, announced the beginning of an effort to evaluate the status of the Tri-Color Bat. *It is likely these species will become federally-listed (and State-listed) at some point during the useful life of this facility*.

The Department believes it is important to evaluate the bat populations in and near the project area to determine the level of risk to bats which are currently listed as endangered or threatened, or are likely to become so.

Before the 2013 advent of White-Nose Syndrome (WNS) in Illinois, there had been no reported losses of Indiana Bats or Northern Long-Eared Bats at Illinois wind turbines, and relatively few reports of mortality for the Little Brown Bat, Tri-Color Bat, or Evening Bat. The hunting and habitat preferences of the two groups of bats account for the great difference in wind turbine mortality. The cave-hibernating species prefer to forage just below, just-above, or within the forest canopy; wind turbines are seldom built in proximity to trees. These bats do fly across and over open spaces, but tend to stay below 30 meters (100 feet), and even lower, and so are much less likely to collide with turbine rotors. By contrast the larger and heavier "tree" bats prefer foraging over open fields and often at higher altitudes, and during higher wind speeds. This is

especially true in August and September when these species migrate from northern breeding grounds to southern climes where food remains available during the winter.

There is an inverse relationship between wind speed and the number of bats in the air, and which species comprise them. Numerous research studies have shown that if turbine operations are initiated at higher wind speeds, total bat mortality can be reduced by more than 50%, and mortality for *Myotis* species by even more. However, the industry trend is to deploy turbines which can begin operations at ever-lower wind speeds, thus making more areas with lesser wind resources viable locations for wind energy facilities. Whereas the turbines deployed earlier in Illinois could cut-in at wind speeds of 4.5 or 4.0 meters per second (m/s), the larger more modern turbines do so at 3.5 and even 3.0 m/s.

To date, one Indiana Bat and four Northern Long-Eared Bats have been reported killed at Illinois wind turbines.[8] Each turbine associated with a death was being operated "normally," that is, in accordance with manufacturers' recommended wind speeds (no curtailment), and all but one of these bats died during the fall migration period, which may begin as early as mid-July and runs through October in most parts of Illinois. These facts strongly suggest these bats were killed at wind speeds below 5.0 mps. Currently, based on experience in this State, the Department is recommending that turbine operations be curtailed below wind speeds of 5.0 m/s between July 15 and October 15 to avoid killing listed bats; this is also the wind speed which reduces total bat mortality of all species by approximately 50%. However, unless directed by the local government with jurisdiction, or pursuant to a State or federal Incidental Take Permit,[9] operation of a wind facility in this manner remains voluntary with the facility owner.

Mortality Monitoring

Every wind energy project presents the opportunity to learn more about this technology's effects on wildlife. Each wind energy project is unique in many respects. One of these is its location. While to human eyes the Morgan County landscape appears much the same as the landscape in other Central Illinois counties with wind energy projects, its physical context is different than in other places.

Experience in Illinois and Indiana has shown that the make and model of turbines comprising a project is a significant factor in wildlife mortality.[10] It can be misleading to compare wind energy facilities while ignoring this factor. The wind turbines selected for this project will be among the largest deployed so far in Illinois, being taller, with larger rotors, and having more

[8] Approximately 2,700 commercial utility-scale wind turbines are operating in Illinois.

[9] At present, only one wind energy facility in Illinois possesses both a federal and state Incidental Take permit, the Pioneer Trail facility in Ford and Iroquois Counties (Illinois ITA #134). After two years of operating only above 5.0 m/s during the period from August 1 to October 15, no *Myotis* species of bats were killed, and the average mortality per turbine was held to about 7.5 bats per turbine. That facility deploys 1.6-MW General Electric turbines. Permits for other facilities are pending.

[10] At the Fowler Ridge project in Indiana, three different turbine types were deployed; mortality monitoring established that each type had a significantly different mortality rate.

robust generators which will generate stronger magnetic fields around each nacelle. Based on the Department's assessment of the performance of other Illinois wind energy projects, the Department predicts the turbines of this project will pose a greater risk to migratory "tree" bats, a lesser risk to *Myotis* genus bats, and a greater risk to migratory birds than has been demonstrated by other Illinois wind energy projects. Whether these predictions will be borne out can only be known through gathering mortality data.

Mortality data also demonstrate whether avoidance and minimization measures are effective. Are measures applied during the correct season? Only data can tell us. For this reason, the Department suggest monitoring begin several weeks prior to operational curtailment to provide a comparison period. Alternatively, an assessment of effectiveness can be made by not curtailing a fraction of the turbines for a comparison against those which are, but taking that approach must be balanced against the risk of taking a listed species at the non-curtailed machines.

Should the developer/operator choose to deploy a bird/bat deterrent technology (several types are under development) only mortality data can demonstrate that it works…or does not. And additional species of bats are likely to become listed, directly or indirectly due to wind energy deployment. Mortality monitoring data will be of equal or greater value to the industry as it will to regulators.

Lined Snake

The State-listed threatened **Lined Snake**, *Tropidoclonion lineatum*, is a small reptile with fewer than a dozen documented records across the State. Its primary food is earthworms and this snake spends much of its time underground, so prairie-like or grassy unconsolidated wetter soils provide the necessary habitat. Most often active at night, it is sometimes active after rainfalls. which drive earthworms to the surface.

In appearance the Lined Snake strongly resembles the Garter Snake, which is unnecessarily fatally persecuted by many homeowners, so that many Lined Snakes may suffer the same fate. However, each belly-scale of the Lined Snake contains two black "half-moon" markings which are a distinguishing feature.

Modern agricultural practices produce considerable compaction and little cover, so that this animal is now largely restricted to the older portions of urban areas where soils retain much of their original density. In the countryside, this snake has been found only where grassed waterways intersect township roads. Records for this snake exist in both Jacksonville and Springfield, which lie roughly in the center of what was believed to be this animal's main range in Illinois during the pre-European settlement period.

While no records have been posted for this animal within the project footprint, neither has any survey effort been performed, so it is possible populations of this species persist within the project footprint where habitat conditions remain suitable.

Perhaps the most reliable survey method for this reptile is the use of cover-boards in suspected habitat. These consist simply of a piece of plywood placed on the ground; because reptiles must regulate their body temperature and seek protection from predators, especially hawks, cover boards offer these animals an opportunity to accomplish both objectives. Lifting the board allows surveyors to observe/collect the animal. The Department suggests cover boards should be placed in the public rights-of-way where proposed private roads (for turbine access) are anticipated to intersect them to determine whether this species remains present within the footprint.[11] Such a survey effort should be coordinated with County or Township road authorities.

Stream and Water Quality Protection

Energy facilities entail a great deal of construction disturbance to roads, bridges, culverts, drains, and fields. A single turbine foundation may require the excavation and re-distribution of more than 300 cubic yards of soil. There is a significant risk of erosion with associated siltation and sedimentation of drains and streams. Siltation covers and chokes such habitats, suffocating aquatic organisms. Thus, it is very important that construction crews employ effective erosion controls to prevent the movement of soils into area streams. While this is a central element of the developer's agreement with the Illinois Department of Agriculture, it may fall to the County to assure such measures are fully deployed and adequately maintained.

Consultation on the part of the Department is closed, unless Morgan County desires additional information or advice related to this proposal. In accordance with 17 Ill. Adm. Code 1075.40(h), the County should notify the Department of its decisions on these recommendations in writing: whether it will proceed with the action as proposed; whether it will require modification of the proposed action consistent with the Department's recommendation or otherwise; or whether it will forego the proposed action.

This consultation is valid for two years unless new information becomes available which was not previously considered; the proposed action is modified; or additional species, essential habitat, or Natural Areas are identified in the vicinity. If the action has not been implemented within two years of the date of this letter, or any of the above listed conditions develop, a new consultation is necessary.

The natural resource review reflects the information existing in the Illinois Natural Heritage Database at the time of the project submittal, and should not be regarded as a final statement on the project being considered, nor should it be a substitute for detailed site surveys or field surveys required for environmental assessments. If additional protected resources are encountered during the project's implementation, the applicant must comply with the applicable

[11] Persons collecting, handling, or disposing of fish & wildlife taken from the wild, or attempting to do so, are required to hold scientific collector permits from the IDNR pursuant to Title 17 Ill. Admin. Code Part 520 and Part 1070.

statutes and regulations. Also, note that closure of consultation does not imply IDNR's authorization or endorsement of the proposed action.

Please do not hesitate to contact the Department should any questions arise regarding the Department's review of this proposed action.

Sincerely,

Keith M. Shank, Natural Resource Manager
Impact Assessment Section
Office of Realty & Environmental Planning

ILLINOIS DEPARTMENT OF NATURAL RESOURCES

Applicant: Lincoln Land Wind, LLC
Contact: Jennie Geiger
Address: 310 4th St NE, Ste 200
Charlottesville, VA 22902

Project: Lincoln Land Wind Project
Address: TBD, TBD

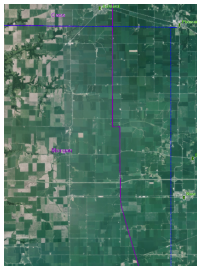
IDNR Project Number: 1808749
Date: 03/14/2018

Description: This is a wind project proposed to be built in Morgan County, IL with a capacity of up to 302 megawatts. The project will interconnect into the planned Ameren 345 kV Meredosia-Austin transmission line, which runs through the project area. The project is in initial stages of development.

Natural Resource Review Results

Consultation for Endangered Species Protection and Natural Areas Preservation (Part 1075)

The Illinois Natural Heritage Database shows the following protected resources may be in the vicinity of the project location:



Bunchflower *(Melanthium virginicum)*

An IDNR staff member will evaluate this information and contact you to request additional information or to terminate consultation if adverse effects are unlikely.

Location

The applicant is responsible for the accuracy of the location submitted for the project.

Disclaimer

The Illinois Natural Heritage Database cannot provide a conclusive statement on the presence, absence, or condition of natural resources in Illinois. This review reflects the information existing in the Database at the time of this inquiry, and should not be regarded as a final statement on the site being considered, nor should it be a substitute for detailed site surveys or field surveys required for environmental assessments. If additional protected resources are encountered during the project's implementation, compliance with applicable statutes and regulations is required.

Terms of Use

By using this website, you acknowledge that you have read and agree to these terms. These terms may be revised by IDNR as necessary. If you continue to use the EcoCAT application after we post changes to these terms, it will mean that you accept such changes. If at any time you do not accept the Terms of Use, you may not continue to use the website.

1. The IDNR EcoCAT website was developed so that units of local government, state agencies and the public could request information or begin natural resource consultations on-line for the Illinois Endangered Species Protection Act, Illinois Natural Areas Preservation Act, and Illinois Interagency Wetland Policy Act. EcoCAT uses databases, Geographic Information System mapping, and a set of programmed decision rules to determine if proposed actions are in the vicinity of protected natural resources. By indicating your agreement to the Terms of Use for this application, you warrant that you will not use this web site for any other purpose.

2. Unauthorized attempts to upload, download, or change information on this website are strictly prohibited and may be punishable under the Computer Fraud and Abuse Act of 1986 and/or the National Information Infrastructure Protection Act.

3. IDNR reserves the right to enhance, modify, alter, or suspend the website at any time without notice, or to terminate or restrict access.

Security

EcoCAT operates on a state of Illinois computer system. We may use software to monitor traffic and to identify unauthorized attempts to upload, download, or change information, to cause harm or otherwise to damage this site. Unauthorized attempts to upload, download, or change information on this server is strictly prohibited by law.

Unauthorized use, tampering with or modification of this system, including supporting hardware or software, may subject the violator to criminal and civil penalties. In the event of unauthorized intrusion, all relevant information regarding possible violation of law may be provided to law enforcement officials.

Privacy

EcoCAT generates a public record subject to disclosure under the Freedom of Information Act. Otherwise, IDNR uses the information submitted to EcoCAT solely for internal tracking purposes.

Black-billed Cuckoo and Upland Sandpiper Habitat Assessment for the Proposed Lincoln Land Wind Project

Appendix A: Voucher Photographs of Upland Sandpiper and Black-billed Cuckoo Habitat at the proposed Lincoln Land Wind Project 8

INTRODUCTION

Western EcoSystems Technology, Inc. (WEST) completed a habitat assessment for the state endangered upland sandpiper (UPSA; *Bartramia longicauda*) and state threatened black-billed cuckoo (BBCU; *Coccyzus erythropthalmus*) for the proposed Lincoln Land Wind Project (Project) in Morgan County, Illinois. The purpose of the assessment was to identify suitable breeding and nesting habitat for UPSA and BBCU within the Project area to inform project design and construction timelines. Surveys were completed in accordance with IDNR recommendations to avoid potential impacts to state-listed bird species during the breeding season since both species had been documented during onsite avian use surveys (Brown and Wilson 2019).

HABITAT DESCRIPTIONS

Upland Sandpiper

The UPSA is a grassland-obligate species that historically occupied native prairie habitat throughout its breeding range, which includes northern and central Illinois (Houston et al. 2011). UPSA prefers grassland mosaics that consist of short grass for foraging (less than four inches [in]; 10 centimeters [cm] tall) and medium grass to conceal nests (6−12 in [15−31 cm]). The species of grass does not appear to be an important selection factor for nesting (US Department of Agriculture [USDA] Forest Service 2003, Illinois Natural History Survey [INHS] 2018, Dorio and Grove 1976). As such, suitable UPSA habitat consists of native prairies, native and non-native grasslands, meadows, hayfields, pastures, and right-of-ways along roads and railroads, especially when these areas are relatively large in size and grasses are of appropriate height (USDA Forest Service 2003, Helzer and Jelinski 1999). Almost no native prairie habitat remains across Illinois; therefore, pasture and hayfields are considered the preferred habitat for UPSA breeding in the state (INHS 2018). With limited native habitat available, UPSA can be found nesting in ditches, agricultural swales, and grasses adjacent to developed areas; UPSA is also likely to use these marginal areas for foraging when grass is short (USDA Forest Service 2003).

Black-billed Cuckoo

The BBCU nests in a variety of forested habitats characterized by dense clutter and riparian areas (Hughes 2018, National Audubon Society 2009). In the Midwest, riparian thickets and woodlands, as well as wetlands, marshes, early successional forest, and shrub/scrubland appear to be especially important to breeding BBCU. BBCU nests in a variety of microhabitats, including beech-oak forest, aspen thickets, riparian willow stands, and rarely, coniferous trees (Hughes 2018, Cornell Lab of Ornithology 2017). BBCU populations in Illinois have decreased since the early 1900's, and this reduction has been attributed to a loss of important habitat types, such as orchards, hedgerows, and shrubby field boundaries (Graber and Graber 1963, Kleen et al. 2004). While BBCU may occur in a variety of forest and shrubland areas, local abundance of this species may be more closely correlated with irruptions of cicadas (Nolan and Thompson 1975) and caterpillars (Jauvin and Bombardier 1996). An elusive bird, BBCU nests are concealed within

thickets, vines, and shrubs; as such, it often nests within 6.6 feet (ft; 2.0 meters [m]) and up to 21.0 ft (96.5 m) above ground level (NatureServe 2018, IDNR 2017).

METHODS

WEST first completed a desktop assessment to identify potentially suitable UPSA and BBCU nesting habitat using U.S. Geological Survey (USGS) National Land Cover Data (NLCD; USGS NLCD 2011, Yang et al. 2018). NLCD land cover classes that represented potentially suitable BBCU habitat included mixed forest, deciduous forest, woody wetland, shrub/scrub, and evergreen forest. Hay/pasture represented potentially suitable UPSA habitat.

A site visit was then completed on May 14-15, 2019 by a qualified biologist to field verify the areas identified as potentially suitable habitat during the desktop review. Surveys were completed from publicly accessible roads and observations were extrapolated to habitat that wasn't directly observable, when possible. When habitat identified via desktop assessment was not observable from accessible roads and/or obstructed from view by landscape features, the area was designated as "unknown". Areas identified as suitable nesting habitat for UPSA and BBCU in the Project area were further qualified by WEST as either "good" or "marginal" to "fair" as described below (Figure 1). WEST mapped all areas determined to be suitable nesting habitat for BBCU and UPSA, and took photographs of representative areas of suitable habitat.

Habitat Quality

Habitat was defined as "good" for UPSA if it met all the following requirements: 1) grassland mosaic featuring a variety of grass heights for nesting and foraging, 2) had posts or high points for perching, and 3) was relatively large in area compared to available grassland within the Project. Habitat was defined as "fair" or "marginal" for UPSA if available habitat was relatively small and/or did not feature a mosaic of heights that would typically be required for both nesting and foraging. In general, grassy roadside right-of-ways were not mapped as suitable habitat, as they typically were less than 10 ft (three m) in width and therefore considered marginal.

Habitat for BBCU was defined as "good" if it met all the following requirements: 1) forested areas that featured woodlands, thickets, and dense vegetation, 2) featured a riparian feature or water source, and 3) was relatively large in area compared to available forest within the Project. Habitat was defined as "fair" or "marginal" for BBCU if it lacked one or more of these requirements. Small woodlots (less than 5.0 acres [ac]; 2.0 hectares [ha]) were generally not considered BBCU habitat, especially if these areas lacked riparian features and suitable cover for nesting, such as early successional growth or thickets.

RESULTS

The desktop assessment identified approximately 1,495.0 ac (605.0 ha) of potentially suitable breeding habitat for UPSA and 1,086.0 ac (439.5 ha) of potentially suitable breeding habitat for BBCU. Field verification confirmed there were 1,543.5 ac (624.6 ha) of suitable UPSA breeding

habitat and 679.1 ac (274.8 ha) of suitable BBCU breeding habitat within the Project. The majority of habitat for both UPSA and BBCU was determined to be of marginal/fair quality (73% and 59%, respectively; Table 1, Figure 1) and less likely to support breeding UPSA and BBCU than areas of good quality.

Table 1. Suitable black-billed cuckoo and upland sandpiper breeding habitat at the proposed Lincoln Land Wind Project in Morgan County, Illinois.

Habitat Quality	Black-billed Cuckoo Habitat (acres)	Upland Sandpiper Habitat (acres)
Good	252.4	354.3
Marginal / Fair	400.7	1,126.9
Unknown	26.0	62.4
Total*	**679.1**	**1,543.5**

*Difference between totals shown and sums of values are due to rounding.

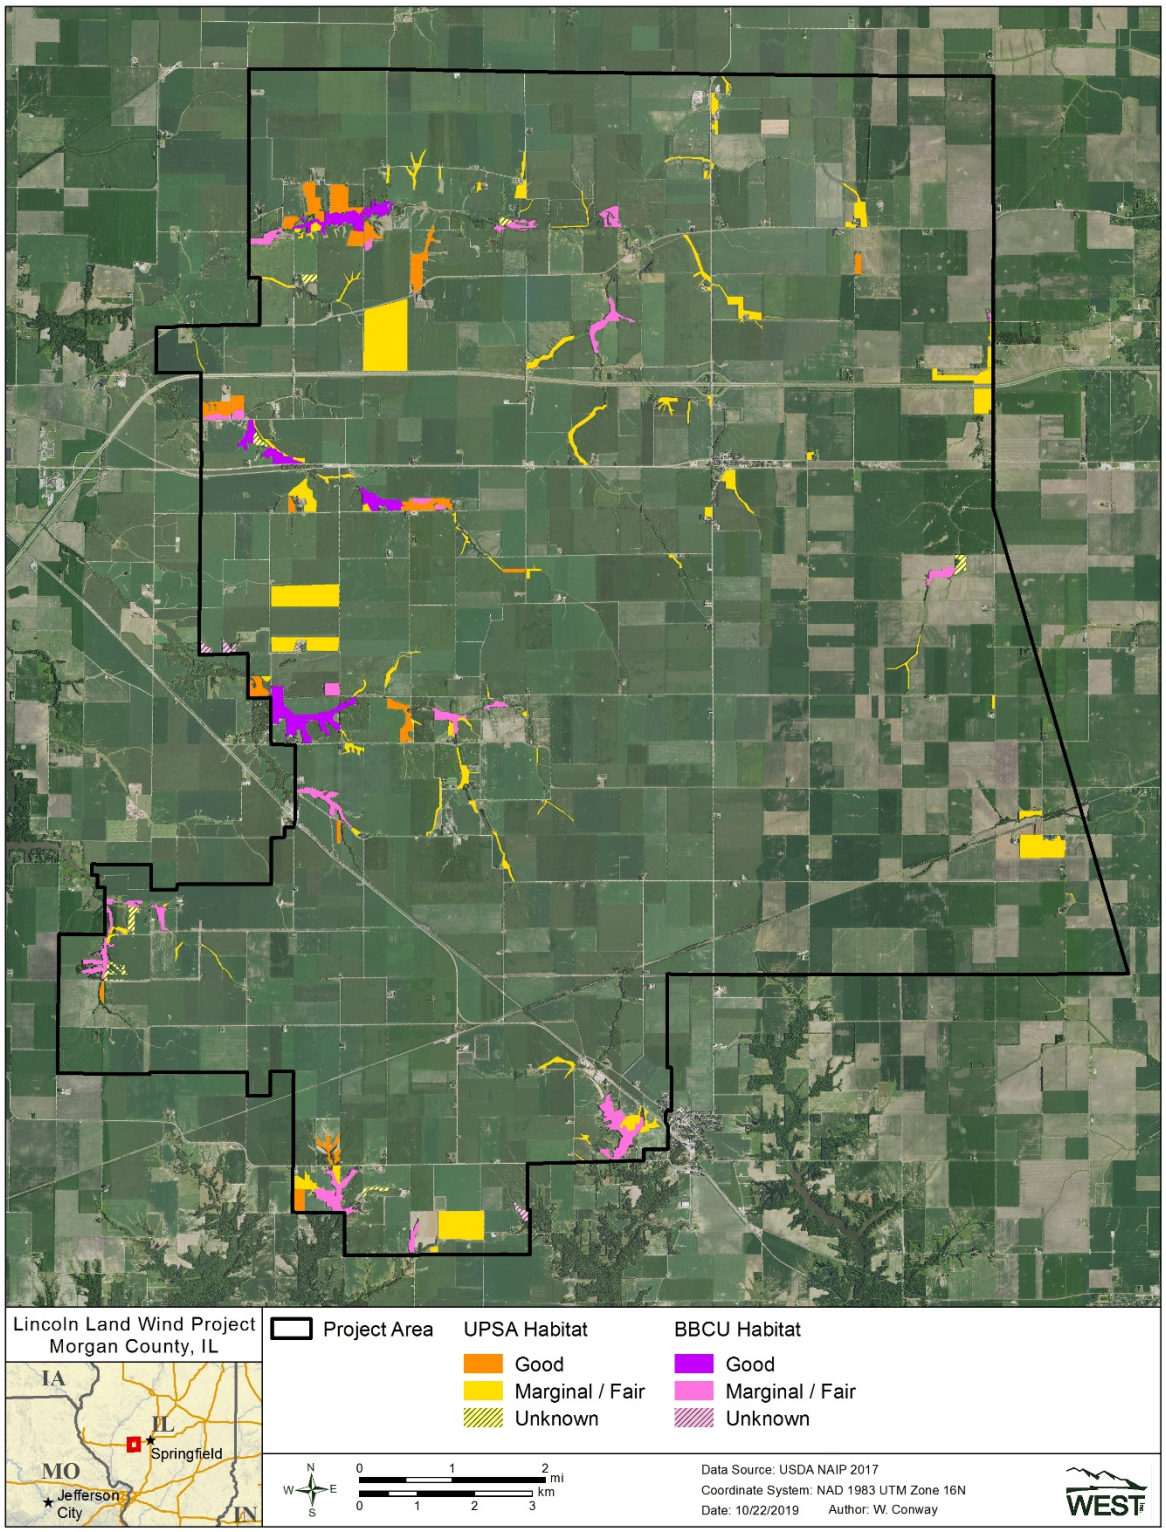

Figure 1. Black-billed cuckoo (BBCU) and upland sandpiper (UPSA) suitable breeding habitat at the proposed Lincoln Land Wind Project in Morgan County, Illinois.

Upland Sandpiper

Suitable habitat for UPSA consisted of pasture, unmown grassland, and agricultural swales. Pasture included areas with planted grasses used for livestock grazing and/or hay. Unmown grasslands were composed mainly of ruderal, non-native grass species (e.g., smooth brome [*Bromus inermis*], reed canarygrass [*Phalaris arundinacea*], Kentucky bluegrass [*Poa pratensis*], and tall fescue [*Festuca arundinacea*]), and mostly consisted of grass-lined streams flowing between agricultural fields. Agricultural swales included non-native, grassy strips in agricultural fields used to direct excess runoff water. Of the suitable habitat for UPSA, 354.3 ac (143.4 ha) were designated as good quality for breeding and featured grassland mosaics to meet foraging and nesting needs (Table 1, Appendix A).

Black-billed Cuckoo

Suitable habitat for BBCU documented within the Project area included thickets, early-successional deciduous forest, riparian forest, shrub-scrub, and forest edges (deciduous and coniferous). Suitable forest habitat commonly included black walnut (*Juglans nigra)*, shagbark hickory (*Carya ovata*), hackberry (*Celtis occidentalis*), sugar maple (*Acer saccharum*), green ash (*Fraxinus pennsylvanica*), red oak (*Quercus rubra*), and American sycamore (*Platanus occidentalis*), and featured cluttered understories and/or early successional growth. Of the suitable habitat for BBCU, 252.4 ac (102.1 ha) were designated as good quality for breeding and featured waterways and densely cluttered forest (Table 1, Appendix A).

CONCLUSION

One UPSA was observed during ongoing avian use surveys and did not occur in typical breeding habitat for the species. Rather, it was seen on a fence post between a gravel road and agricultural field with a narrow right-of-way, which was deemed to be of insufficient size to support a nesting UPSA. However, the sighting does confirm presence within the proposed Project area during the breeding season (Brown and Wilson 2019). To minimize impacts to UPSA during the breeding season, IDNR recommends construction activities within suitable habitat occur outside of the UPSA nesting season, which typically occurs from May 15 through June 30 (IDNR 2018).

Three BBCU observations were recorded during ongoing avian use surveys and occurred in suitable breeding habitat for the species, confirming their presence in the Project during the breeding season (Brown and Wilson 2019). If construction activities avoid suitable BBCU forested habitat, then impacts to nesting BBCU will likely be minimal. If construction necessitates the removal of BBCU habitat, trees should be cleared outside BBCU nesting season, which occurs from late May through late June (Hughes 2018).

While both species have been observed within the Project, suitable UPSA habitat composes only 2.5% of the Project, which decreases to 0.6% if considering only good quality habitat for breeding. Likewise, suitable BBCU habitat composes only 1.1% of the Project, with good quality breeding habitat only 0.4%. Therefore, direct disturbance to suitable nesting habitat may be avoidable

through spatial and/or temporal construction measures. If construction is necessary in suitable habitat during the nesting season, then habitat could be removed prior to the nesting season (i.e., mowed to a height of <4 in [<10 cm] for UPSA or cleared for BBCU). If pre-nesting habitat removal is impracticable, a biologist could survey the relevant area for nesting UPSA or BBCU prior to disturbance. In this scenario, areas of good habitat for either species represent zones with a higher likelihood of occurrence, and higher risk of potential construction delays, whereas state-listed birds are relatively unlikely to nest in areas with marginal or fair habitat. Areas labeled as "unknown" should be considered to be good quality habitat until they can be accessed and evaluated in the field.

INTRODUCTION

Western Ecosystem Technologies, Inc. (WEST) completed a habitat assessment and surveys to evaluate presence/probable absence of the lined snake (*Tropidoclonion lineatum*) within the proposed Lincoln Land Wind Project (Project) in Morgan County, Illinois (Figure 1). The surveys were completed in accordance with IDNR recommendations.

The lined snake is a small, semi-fossorial species that is uncommon in parts of its native range in central Illinois counties. Its preferred habitat consists of undisturbed prairie remnants and grasslands along wooded corridors. It can be found in urban lots in former prairie under rocks, logs, leaves, boards and other cover during the day (Illinois Natural History Survey [INHS] 2018). This species is primarily nocturnal but has been observed basking during the day in spring and early fall (Ernst and Barbour 1989, Oldfield and Moriarty 1994). Lined snakes are active from March to November and are most active after heavy rains when the likelihood of catching their principal food source, earthworms, is high (Minnesota Department of Natural Resources [MNDNR] 2008, INHS 2018a, Davis 2017). The lined snake is oviparous and gives birth to live young in late August or September. The snake has been documented approximately 4.4 miles (mi) west of the Project in Jacksonville, Illinois (INHS 2018a).

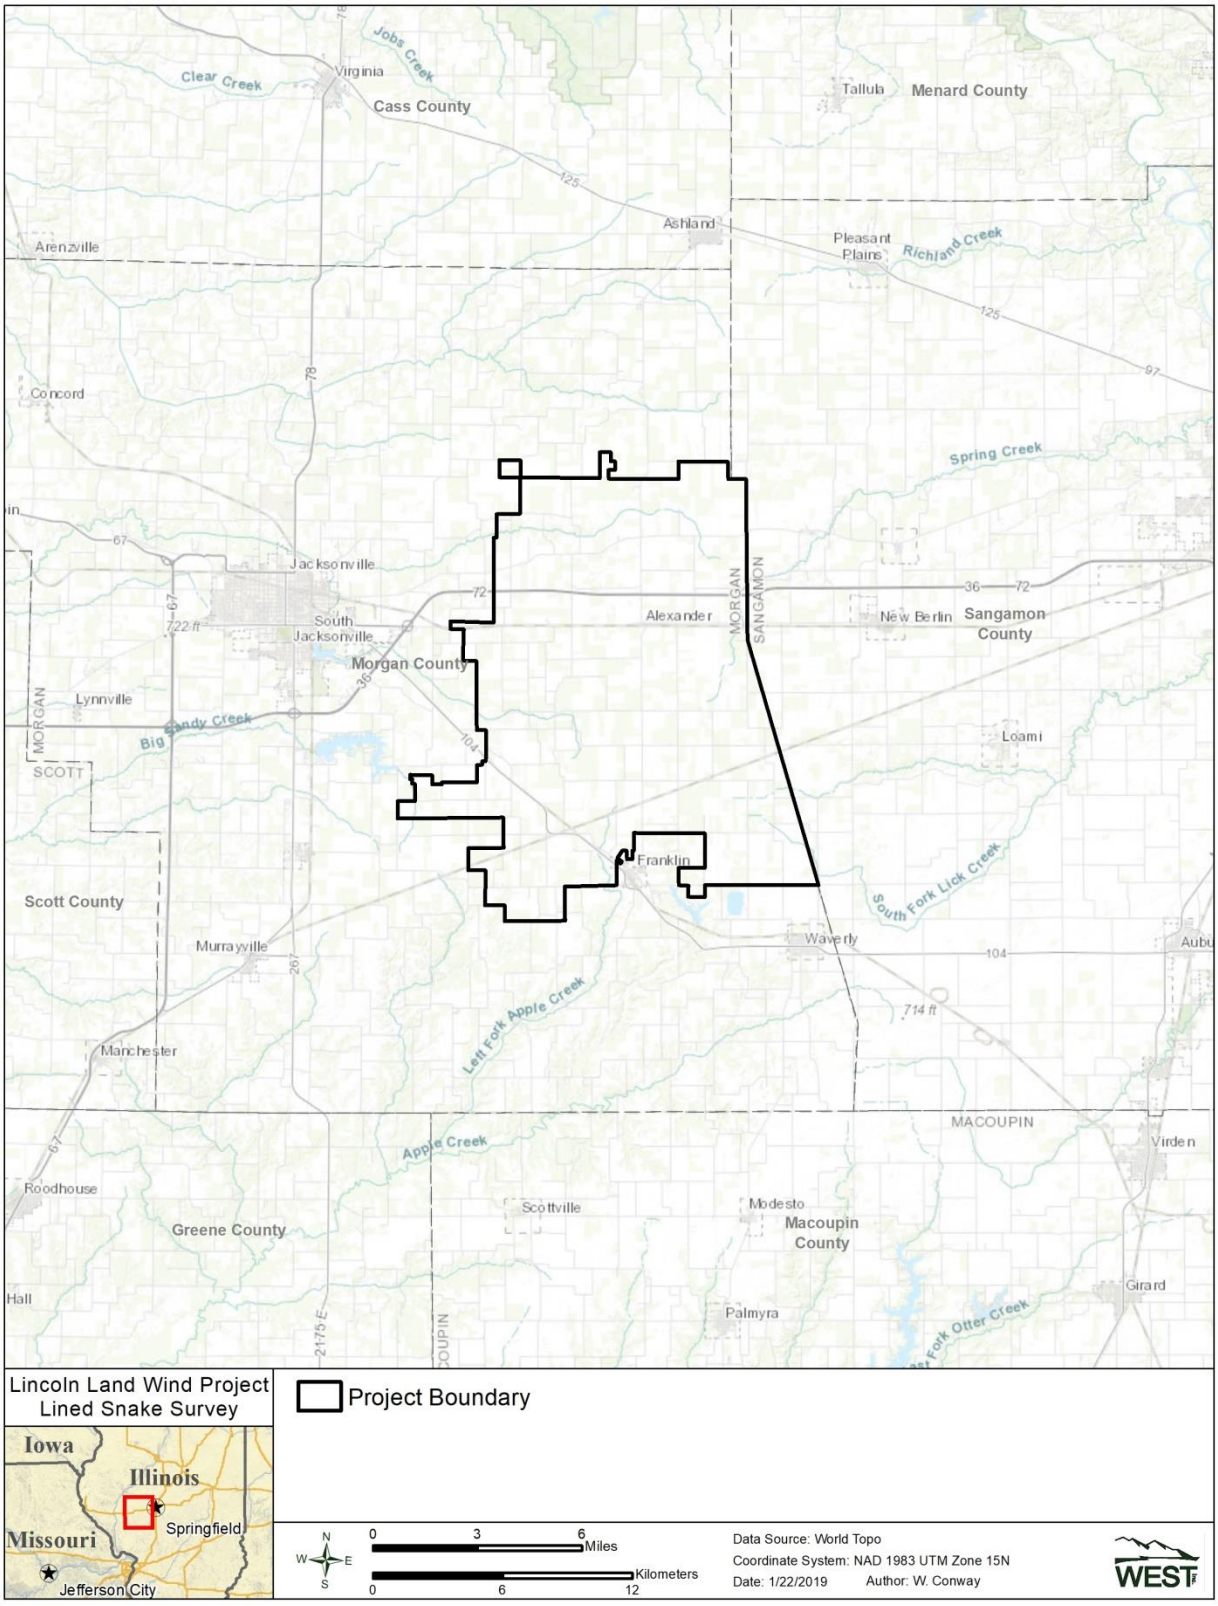

Figure 1. Location of the proposed Lincoln Land Wind Project.

PROJECT AREA

The proposed Project encompasses approximately 62,501 acres (ac) located 3.5 mi east of the town of Jacksonville in Morgan County, Illinois. The Project mainly falls within the Eastern Corn Belt Plains Level III Ecoregion, with a small area of the southern section falling within the Interior River Valleys and Hills ecoregion (Woods et al. 1998, U.S. Environmental Protection Agency [USEPA] 2013). The Eastern Corn Belt Plains consists of the area from central Illinois north to the Wisconsin border and contains highly fertile soil that hosts vast farms that grow corn (*Zea mays*), soybean (*Glycine max*), and winter wheat (*Triticum aestivum*), as well as livestock. Forests in the area have largely been cleared for farming and are now mainly restricted to riparian or park lands. The Interior River Valleys and Hills ecoregion consists of areas draining into large rivers creating valleys that are approximately half cropland, thirty percent pasture, and twenty percent naturally growing forest (USEPA 2013).

Cultivated cropland composes the majority of the Project area (89.5%), followed by developed land (5.5%), hay/pasture (3.2%) and deciduous forest (1.6%; Table 1). All other habitat types individually make up less than 1.0% of the Project (Table 1; US Geological Survey [USGS] 2011).

Table 1. Land cover/land use types and composition within the proposed Lincoln Land Wind Project Area in Morgan County, Illinois.

Land Cover Class	Acres	Percent (%) Composition
Cultivated Crops	55,963.1	89.5
Developed	3,451.7	5.5
Hay/Pasture	2,003.1	3.2
Deciduous Forest	1,020.9	1.6
Open Water	34.7	0.06
Woody Wetlands	19.6	0.03
Evergreen Forest	8.0	0.01
Total*	**62,501.1**	**100%**

* Totals may vary based on rounding.

Data were obtained from US Geological Survey National Land Cover Database compiled from satellite imagery (2011, National American Datum 1983).

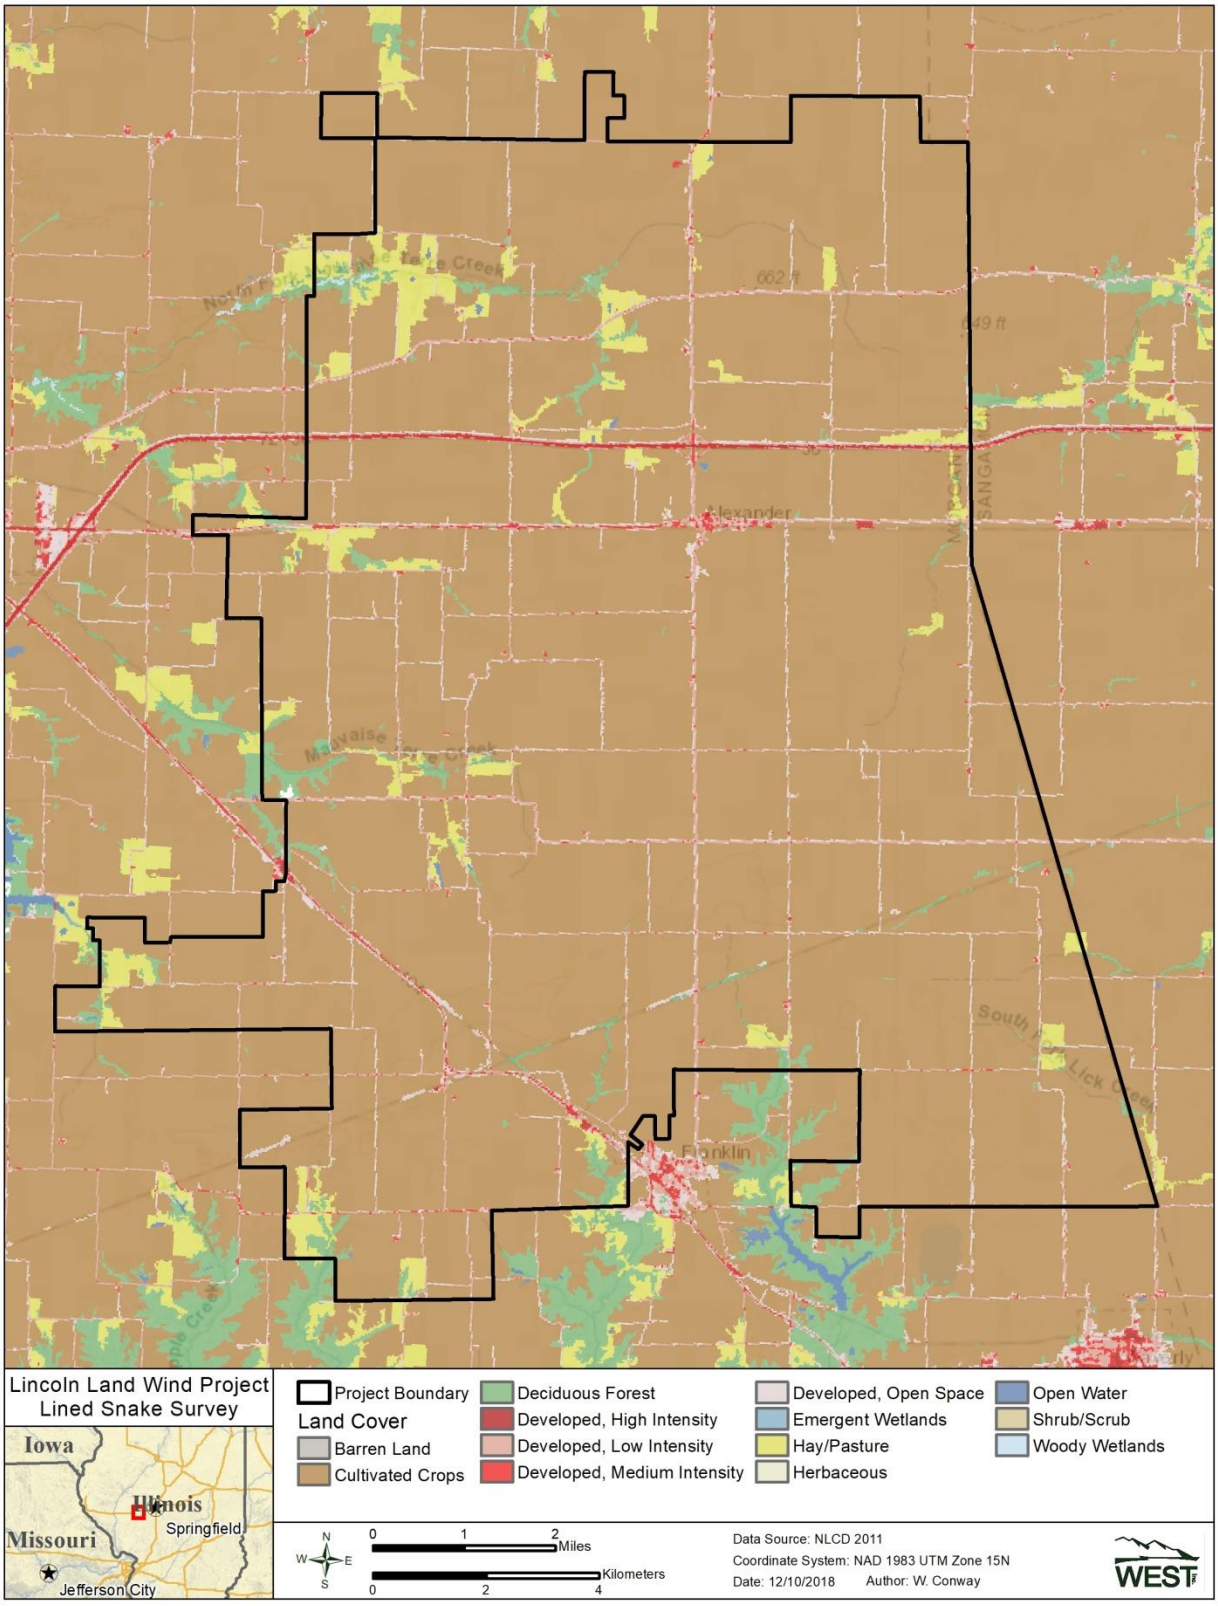

Figure 2. Composition of land cover within the proposed Lincoln Land Wind Project area.

METHODS

The survey methodology included a desktop habitat assessment and ground-truthing, as well as presence/absence surveys in accordance with the October 2, 2018 survey plan approved by IDNR (Brown 2018; Appendix A).

Desktop Habitat Assessment and Ground-Truthing

Geographic Information System layers, including aerial photography, National Land Cover Database (NLCD) data, a Conservation Reserve Program shapefile, and U.S. Fish and Wildlife National Wetland Inventory data were evaluated via desktop review to identify potentially suitable habitat, which was defined as grass-lined agricultural swales, unmanicured portions of roadside ditches, railroad verge, pasture, semi-native herbaceous areas, shrub-scrub areas, and fallow areas of farmsteads. A WEST field biologist then completed field surveys on August 18-20, 2018 to ground-truth the results of the initial desktop assessment and refine mapping as appropriate.

Results of the habitat assessment were further refined to identify areas of higher quality suitable habitat, defined as areas of minimal human-caused disturbance with a patch size of 10 acres or greater and connectivity to other similar patches (as well as smaller patches that were part of a complex of connected habitat). Areas deemed as higher quality habitat were selected for presence/probable absence surveys with the assumption that if the higher quality sites are unoccupied, then the lower quality sites are likely to be unoccupied as well (Keith Shank, IDNR, personal communication, September 27, 2018).

Lined Snake Survey

In accordance with IDNR recommendations and the Project study plan (Brown 2018), WEST utilized cover boards to assess presence/probable absence of lined snakes within ten sample areas identified as high quality habitat during the desktop assessment. Due to land access difficulties, two sites identified in the study plan could not be sampled, and alternate sites were chosen (Figure 3). Three plywood cover-boards per sample area were deployed within each sample area. Cover-boards consisted of 3x4-feet (ft) or 2x4-ft pieces of plywood laid on the ground in order to provide shelter for reptiles. Cover-boards were laid on or adjacent to areas of grassy vegetation, with preference given to areas where boards could be laid on bare soil adjacent to herbaceous vegetation.

Cover-boards were placed in locations where they were unlikely to be noticed and disturbed by the public. Cover-boards were left in place for at least three nights before being checked for the first time, and then they were checked once per week until the average ground temperature in the vicinity of the Project was below 50° Fahrenheit (F; as determined using data from http://www.greencastonline.com/tools/soil-temperature). Cover-boards were checked during the day, when temperatures were between 50 and 80° F, and the weather was recorded during each check (temperature, wind speed, and precipitation). In addition, biologists searched under existing cover items (e.g., trash, boards, and logs) within each site as available. Cover-boards were removed once surveys were complete. All snake species detected were to be recorded,

along with relevant data (i.e., date, time, temperature, species, approximate length, and photographs).

RESULTS

Habitat Assessment

Through desktop assessment and ground-truthing, 288 patches (totaling 1,498 ac) of suitable lined snake habitat were identified in the Project area (Figure 3). Dominant vegetation in areas of suitable habitat was typically non-native cool season grasses (i.e. smooth brome [*Bromus inermis*], reed canary grass [*Phalaris arundinacea*], and tall fescue [*Schedonorus arundinaceus*]) or annual species, such as nodding foxtail (*Setaria faberi*), indicating a likely history of human disturbance. Native prairie plant species were absent from most of the Project area.

In total, 18 patches (217 ac total) of higher-quality habitat were identified. These areas were generally located in pastures, hay fields, and fallow areas that are likely to have been pastures in recent history. Non-native, cool season grasses were still a dominant part of the plant community in these areas, although goldenrod (*Solidago* sp.) and other native forbs were a substantial part of the plant community in some patches (e.g. cover-board locations 2a-2c). Results from the habitat assessment, as well as available land access, were used to identify 10 representative higher-quality sites where surveys for lined snakes were conducted (Figure 3; Appendix B).

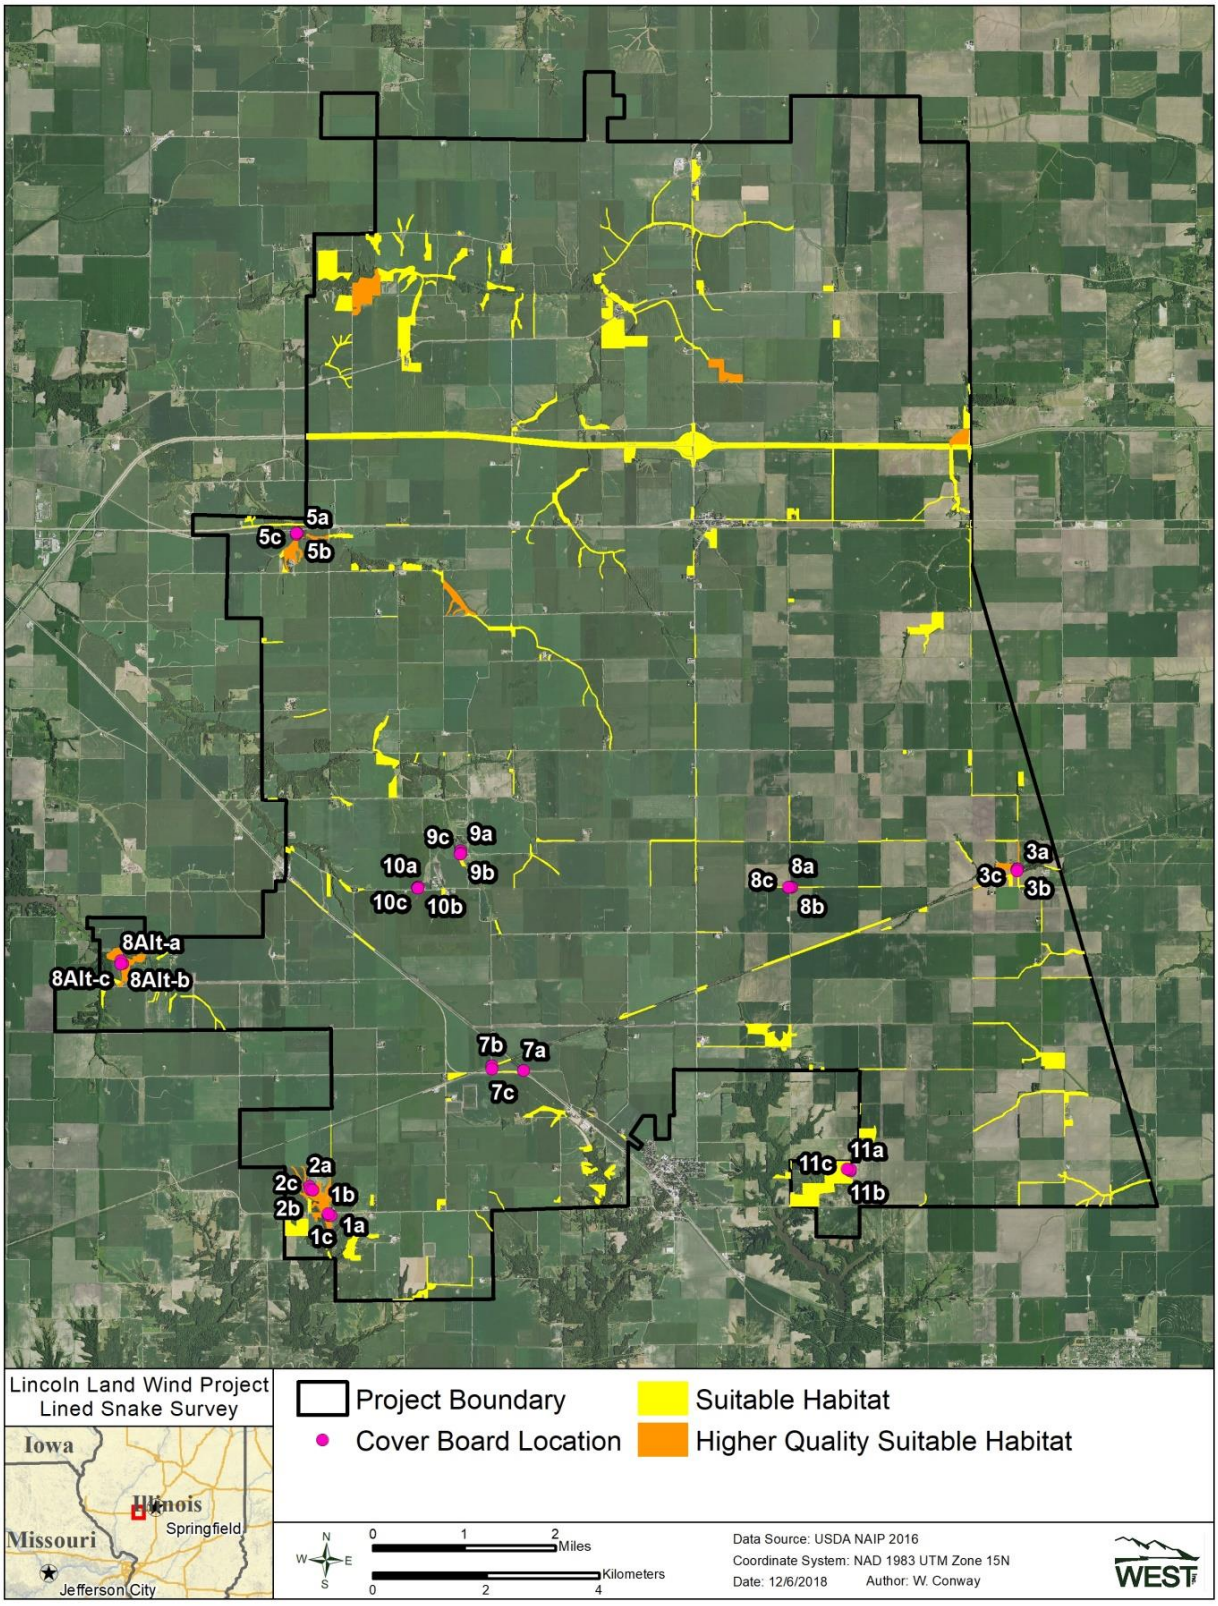

Figure 3. Cover-board locations in relation to suitable habitat for lined snakes (*Tropidoclonion lineatum*) at the Lincoln Land Wind Project in Morgan County, Illinois.

Lined Snake Survey

The field assessment resulted in no observations of reptiles, although other fauna were observed under cover-boards and in-situ cover items (i.e., trash and boards). During the cover-board checks there was one instance of an American toad (*Anaxyrus americanus*) and six instances of small mammals recorded underneath cover-boards (three instances of mice [*Peromyscus* sp.] and three instances of northern short-tailed shrews [*Blarina brevicauda*]; Table 2). In addition, tunneling by small mammals and invertebrates was evident under many of the cover-boards (Appendix C), and preferred lined snake food items (i.e., earthworms [Annelida]) were also observed.

CONCLUSIONS

The habitat with the highest probability for lined snake occurrence on accessible lands was selected for surveys, and surveys were completed during a period of time when lined snakes are active. The presence of small mammals, an amphibian, and earthworms under the cover-boards suggests that the boards were in place for sufficient time to attract other semi-fossorial and fossorial fauna, including lined snake prey items. No lined snakes were found under cover-boards or existing cover items, suggesting likely absence of lined snakes from the Project area.

This strikes me as an appropriate effort, and perhaps just in time, since it seems the weather is turning this week.

Southwest Morgan County recorded a Copperhead in 1943, and that's the northernmost record I could find for that species. Timber Rattlers are pretty much confined to river bluffs, and there are no known Massasauga populations north of Carlyle at this time. So venomous reptiles are unlikely. Kirtland's Snake, another listed snake in Illinois, is a possibility; there are some around Springfield.

Subject: [External] BUSINESS CONFIDENTIAL: Proposed Lined Snake Surveys

Hi Keith –

As discussed last Friday, we are seeking to complete presence/probable absence surveys for lined snakes at the Lincoln Land Wind Project in Morgan County, Illinois. The attached Study Plan provides the results of the initial habitat assessment that was completed for the Project, presents the methodology utilized to identify areas of higher quality habitat to focus survey efforts, as well as presents the proposed methodology for the presence/probable absence surveys.

If you could please review the proposed Study Plan and provide concurrence or suggested revisions as soon as possible we would appreciate it as we are seeking to initiate surveys later this week.

Thanks,
Jennie

Avian Use Surveys for the Proposed Lincoln Land Wind Project Morgan County, Illinois

FINAL REPORT

April 13, 2018 – March 27, 2019

Prepared by:

EXECUTIVE SUMMARY

Western EcoSystems Technology, Inc. completed year-round avian use surveys for the proposed Lincoln Land Wind Project (Project) located in Morgan County, Illinois. The objective of the surveys was to evaluate species composition, and seasonal and spatial use of the Project by birds, with a particular focus on eagles and sensitive species. The surveys were consistent with the recommendations outlined in the US Fish and Wildlife Service (USFWS) 2012 *Land-Based Wind Energy Guidelines,* the USFWS 2013 *Eagle Conservation Plan Guidance* (ECPG), the USFWS 2016 *Revisions to Regulations for Eagle Incidental Take and Take of Eagle Nests,* as well as recommendations from USFWS and the Illinois Department of Natural Resources.

Surveys were completed monthly from April 13, 2018 – March 27, 2019, at 40 points established throughout the Project area. Surveys consisted of 5-minute (min) counts for small birds within 100-meter (m; 328-foot [ft]) radius plots, followed by 60-min counts within 800-m (2,625-ft) radius plots, where raptors and large birds were counted in the first 20 min and only eagles and sensitive species were recorded for the remaining 40 min. Observations of sensitive species (defined as species afforded protection under the Endangered Species Act, Bald and Golden Eagle Protection Act, listed as threatened and endangered by the state of Illinois or birds of particular concern defined by the USFWS Information for Planning and Consultation [IPaC]), were recorded any time they were observed.

Eighty-one small bird species and 40 large bird species were recorded during the point-count surveys. Small bird use was highest during the summer (31.16 birds/100-m plot/5-min survey) and lowest during the winter (3.40). Large bird use was highest during the spring (14.28 birds/800-m plot/20-min survey) and lowest during the winter (3.51). Seasonal diurnal raptor use was as follows: summer (1.10 bird/800-m plot/20-min survey), spring (0.64), fall (0.37), and winter (0.32).

Eleven bald eagle observations and one golden eagle observation were recorded during the surveys and three bald eagle observations were recorded incidentally. All eagle observations were recorded in the central portion of the Project. Bald eagles were only observed during the fall (0.04 birds/800-m plot/60-min survey) and winter (0.05), and the golden eagle was recorded in the spring.

No federally threatened or endangered bird species were observed during the surveys. Three state-listed birds were documented during the surveys (black-billed cuckoo [threatened], northern harrier [endangered], upland sandpiper [endangered]), and one state-listed species was documented incidentally (short-eared owl [endangered]). The black-billed cuckoo and upland sandpiper were the only state-listed species observed during their breeding season, indicating that they may nest within the Project area. Four migratory birds of particular concern were also observed in the Project area during surveys, including American golden plover, bobolink, Henslow's sparrow, and red-headed woodpecker.

Overall, the Project is likely to have low impact to small or large bird populations, including diurnal raptors and sensitive species. Presence of sensitive species may warrant special management consideration during construction to avoid disturbance to potential breeding birds. Most common species observed are widespread and abundant, suggesting relatively low risk of adverse impacts to bird populations. Bald eagle use was limited to fall and winter and the one golden eagle was observed in the spring, which indicates that both species are likely migrating or wintering and not using the Project during the breeding season.

INTRODUCTION

Western EcoSystems Technology, Inc. (WEST) completed avian use surveys from April 13, 2018 – March 27, 2019, for the proposed Lincoln Land Wind Project (Project) located in Morgan County, Illinois (Figure 1). The objective of the surveys was to evaluate avian species composition, and avian seasonal and spatial use at the Project, with a particular focus on eagles and sensitive species. Survey protocols were consistent with recommendations outlined in the US Fish and Wildlife Service (USFWS) *Land-Based Wind Energy Guidelines* (USFWS 2012), the USFWS *Eagle Conservation Plan Guidance* (ECPG; USFWS 2013), the USFWS *Revisions to Regulations for Eagle Incidental Take and Take of Eagle Nests* (USFWS 2016), as well as recommendations from USFWS and the Illinois Department of Natural Resources (IDNR).

PROJECT AREA

The proposed Project area is located in Morgan County, Illinois, approximately 2.4 kilometers (km; 1.5 miles [mi]) east of Jacksonville, Illinois. According to the National Land Cover Database (NLCD), the Project area is dominated by cultivated cropland (89.4%; Table 1, Figure 2; US Geological Survey NLCD 2011, Homer et al. 2015). The next most common cover type is developed areas, which compose 5.5% of the Project area, followed by hay/pasture (3.3%) and deciduous forest (1.7%; Table 1). All other land cover types compose less than 0.1% of the Project area, individually (Table 1, Figure 2).

Table 1. Land cover types and composition in the proposed Lincoln Land Wind Project.

Land Cover Type	Acres	Percent Composition
Cultivated Crops	57,598	89.4
Developed	3,517	5.5
Hay/Pasture	2,142	3.3
Deciduous Forest	1,075	1.7
Open Water	35	<0.1
Woody Wetlands	21	<0.1
Evergreen Forest	8	<0.1
Total[a]	**64,396**	**100**

Data from US Geological Survey National Land Cover Database 2011, Homer et al. 2015

[a] Sums of values shown may not equal total value shown due to rounding.

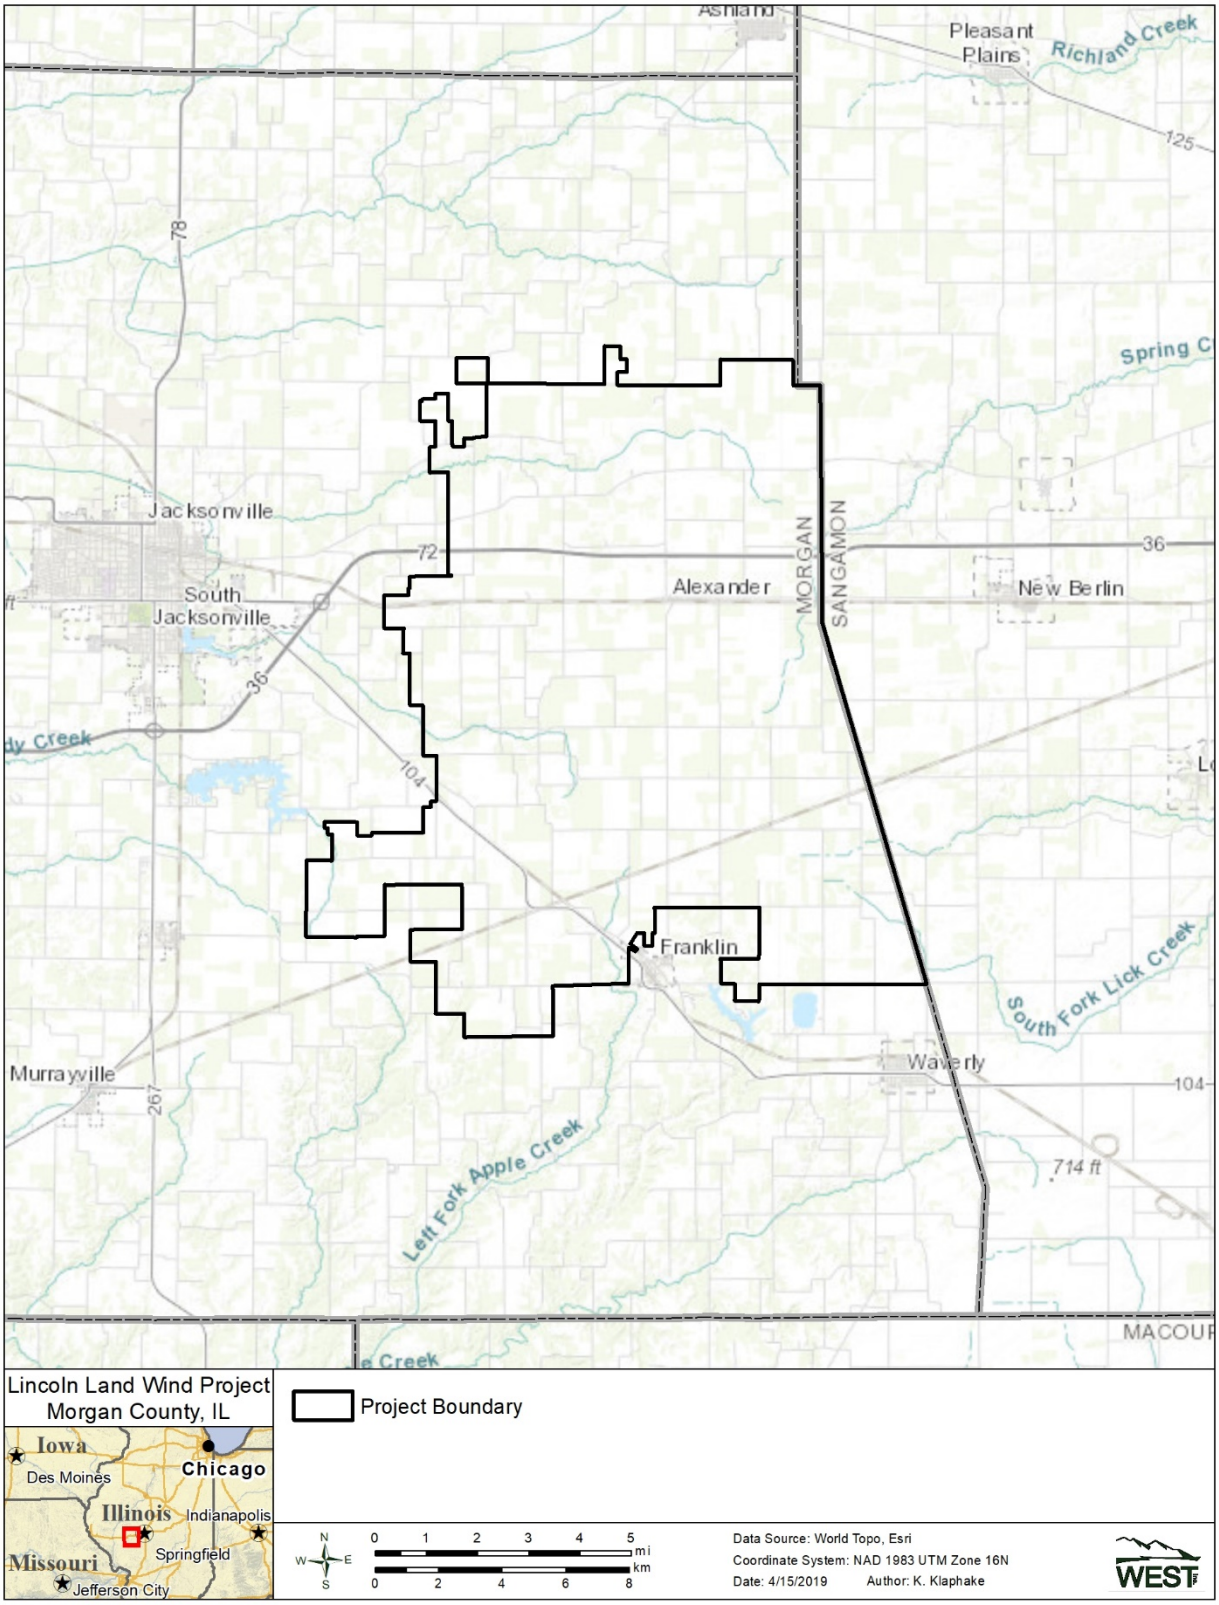

Figure 1. Location of the proposed Lincoln Land Wind Project in Morgan County, Illinois.

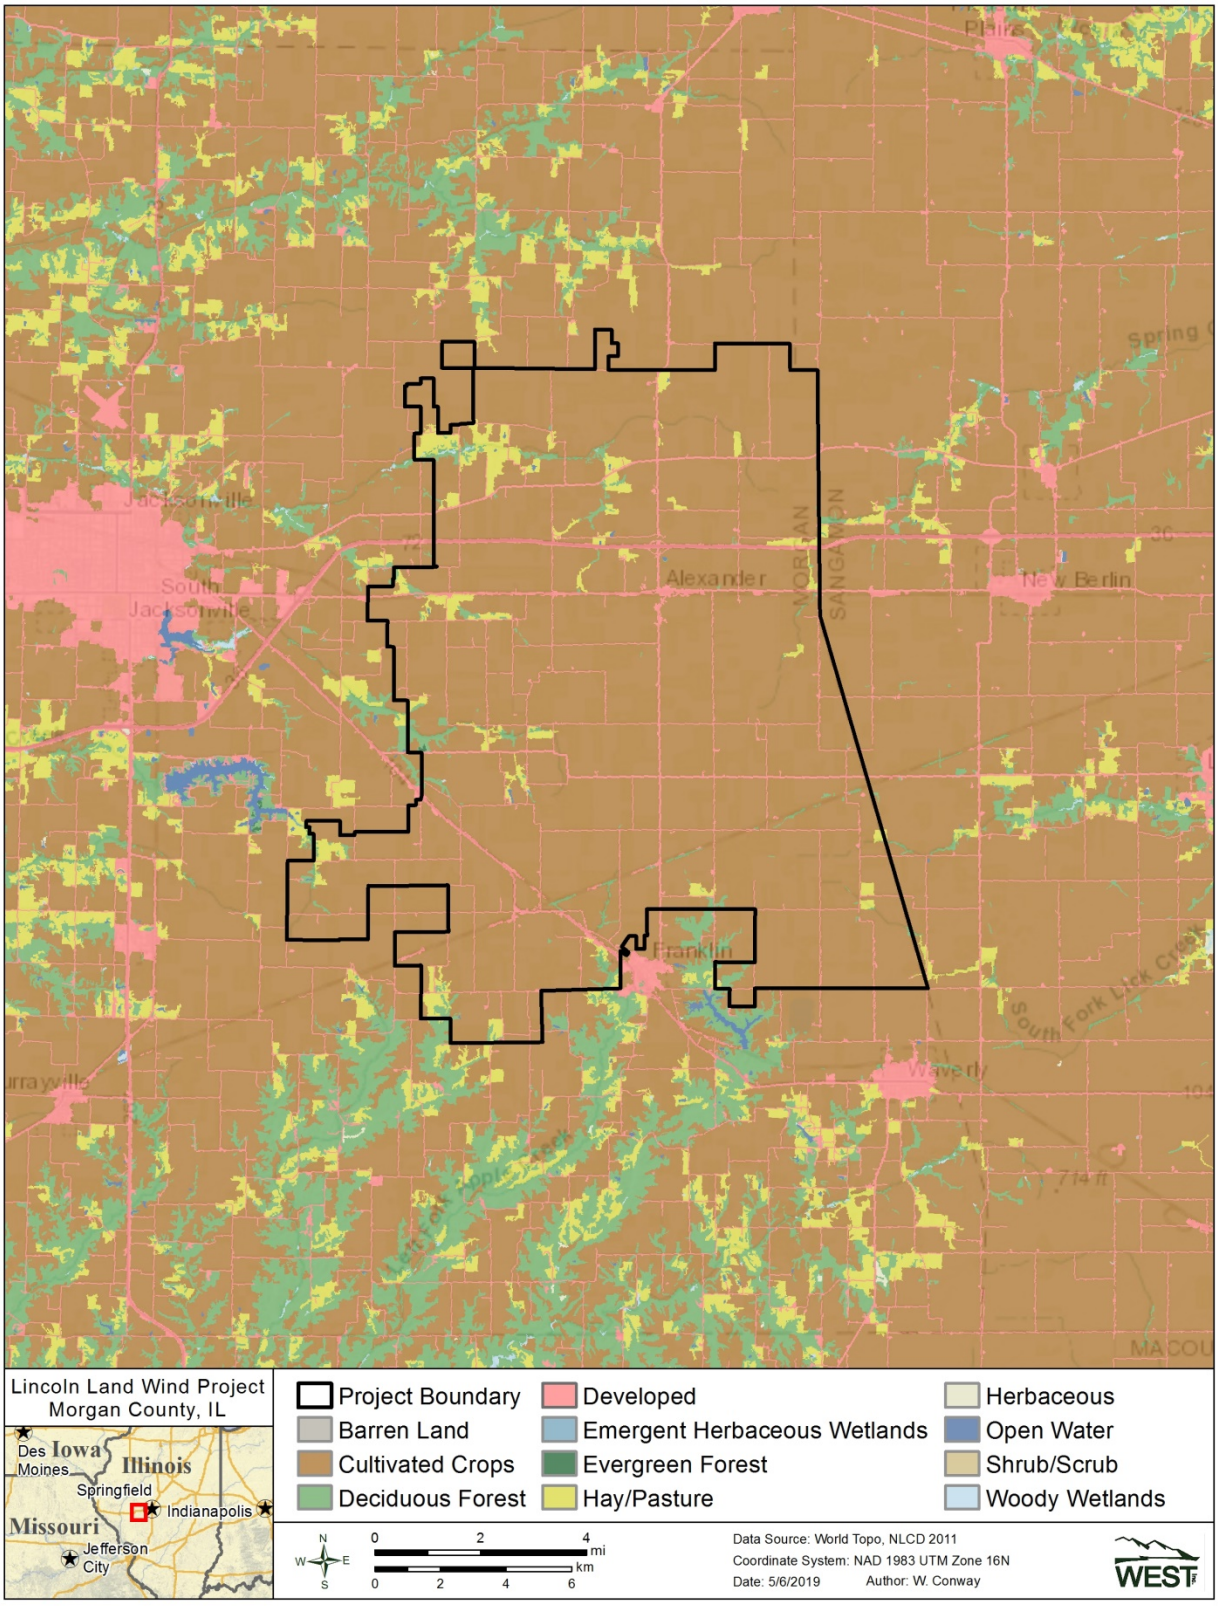

Figure 2. Land cover in the proposed Lincoln Land Wind Project (US Geological Survey National Land Cover Database 2011, Homer et al. 2015).

METHODS

Monthly avian use surveys were completed from April 13, 2018 – March 27, 2019 at 40 points established throughout the Project area, in accordance with the methods described by Reynolds et al. (1980). Within the initial Project boundary, 36 avian use points were surveyed. The Project boundary was revised in January 2019 when three additional points were added, and again in February 2019 when one additional point was added (Figure 3). All points within the initial Project boundary were surveyed monthly for an entire year to achieve at least 30% annual coverage (USFWS 2013).

Point count surveys were completed for 65 minutes (min), with small birds recorded within 100 meters (m; 328 feet [ft]) for the first five min; all raptors and large birds (including eagles) recorded out to 800 m (2,625 ft) for the next 20 min; and only eagles for the remaining 40 min of each 65-min survey. The 60-min eagle use survey methodology is consistent with the methods recommended in the ECPG. For purposes of this study, small birds were defined as hummingbirds, swifts, woodpeckers, and passerines; large birds were defined as waterbirds, waterfowl, shorebirds, gulls and terns, diurnal raptors (kites, accipiters, buteos, eagles, falcons, northern harrier [*Circus hudsonius*], and osprey [*Pandion haliaetus*]), owls, vultures, and upland game birds.

Observations of sensitive species (defined as species afforded protection under the Endangered Species Act [1973]; Bald and Golden Eagle Protection Act [1940]; listed as threatened or endangered by the state of Illinois [Illinois Department of Natural Resources 2018]; or birds of particular concern identified in the USFWS Information, Planning, and Consultation System [IPaC] report [USFWS 2019]) were recorded throughout the surveys. Observations of sensitive species outside the appropriate survey period, beyond the 100- or 800-m radius plot, and in transit were recorded as incidental observations to document occurrence on site, but were excluded from statistical analyses.

At each survey point, the date, start and end time of the survey period, and weather information (e.g., temperature, wind speed and direction, and cloud cover) were recorded. Species or best possible identification, number of individuals, sex and age class (if identifiable), distance from plot center when first observed, closest distance, altitude above ground, activity (behavior), and habitat(s) were recorded for each observation. Bird behavior and habitat type where the observation occurred were recorded based upon the point of first observation. Approximate flight height and distance from plot center at first observation were recorded to the nearest 5-m (16-ft) interval. Eagle risk minutes (i.e., minutes of eagles flying within 800 m and below 200 m [656 ft]) were documented in accordance with the ECPG. Locations and flight paths of eagles and state and federally listed species were recorded on field maps by unique observation number.

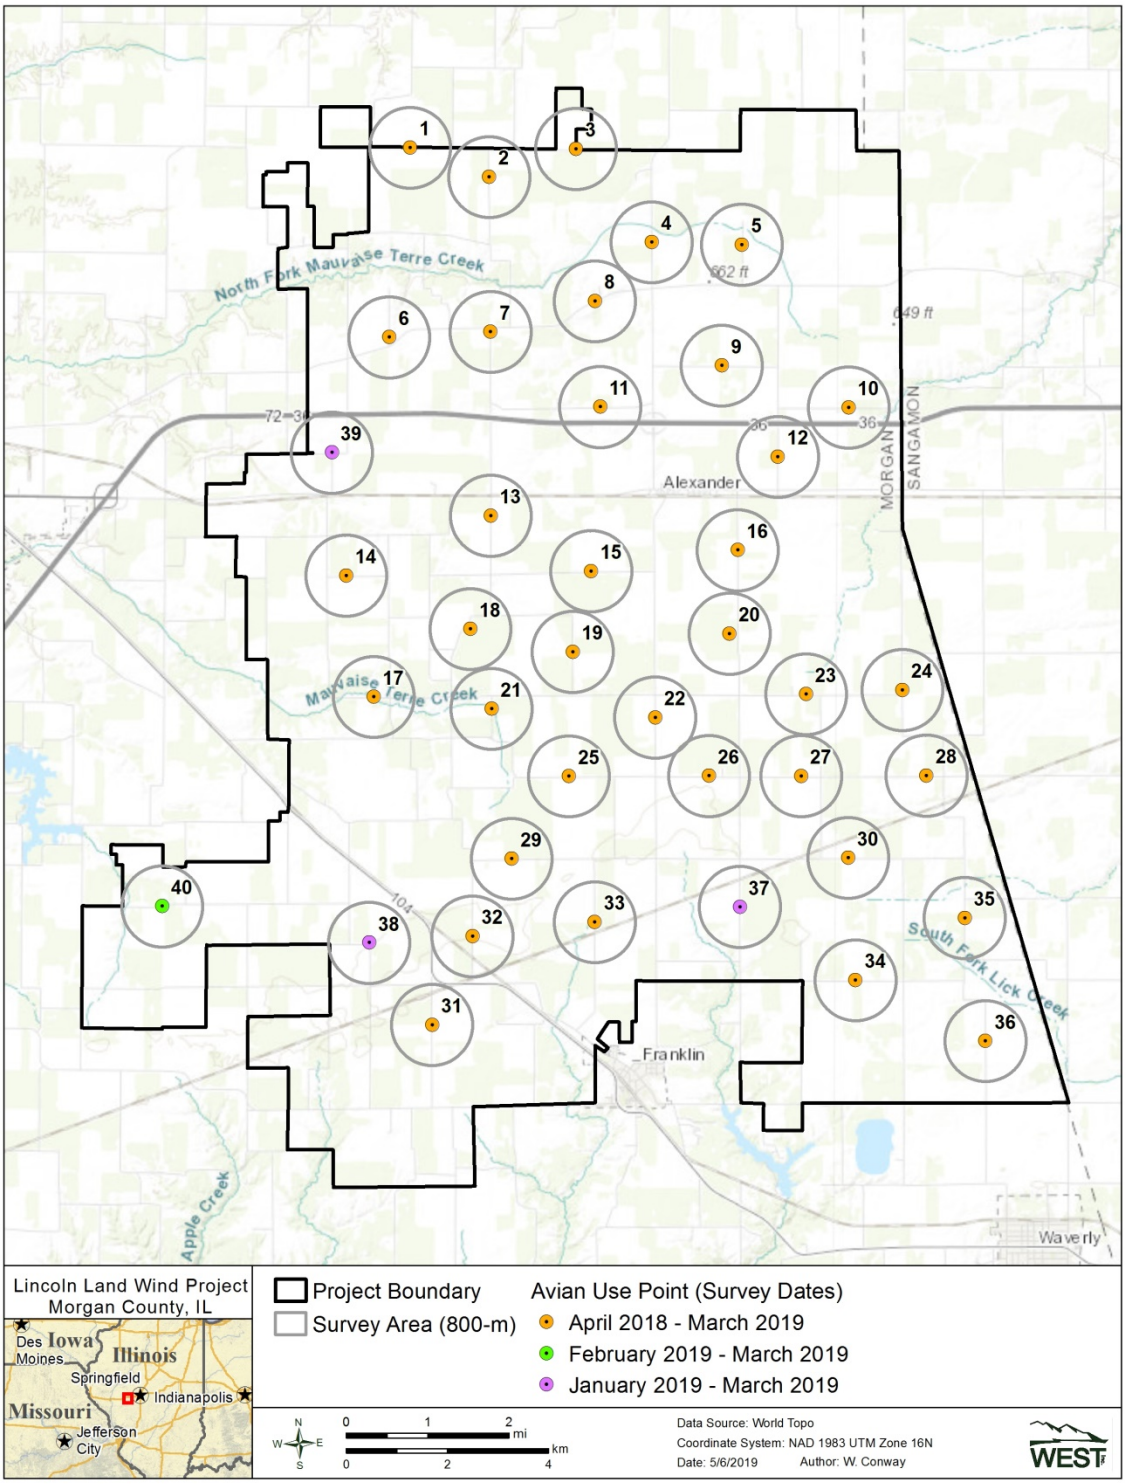

Figure 3. Fixed-point count locations for avian use surveys at the proposed Lincoln Land Wind Project.

Statistical Analysis

Quality Assurance and Quality Control

Quality assurance and quality control (QA/QC) measures were implemented at all stages of the surveys, including in the field, during data entry and analysis, and report writing. Observers were responsible for inspecting data forms for completeness, accuracy, and legibility following each field survey. Potentially erroneous data were identified using a series of database queries. Irregular codes or data suspected as questionable were discussed with the observer and/or project manager. Errors, omissions, or problems identified in later stages of analysis were traced back to the raw data forms, and appropriate changes in all steps were made.

Data Compilation and Storage

A Microsoft® SQL database was developed to store, organize, and retrieve survey data. Data were keyed into the electronic database using a pre-defined protocol to facilitate subsequent QA/QC and data analysis. All data forms and electronic data files were retained for reference.

Fixed-Point Count Avian Use Surveys

For analysis purposes, a visit was defined as the required length of time, in days, to survey all of the plots once within the Project. Seasons were defined as spring (March 28 − June 6), summer (June 7 − September 4), fall (September 5 − December 4), and winter (December 5 − March 27).

Species Richness

Species richness was illustrated by the total number of unique species observed. Species lists (with the number of observations and the number of groups) were generated by season for each survey type and included all observations of small birds detected within 100 m and large birds detected within 800 m. In some cases, the tally may represent repeated sightings of the same individual. Species richness was calculated for each season by first averaging the total number of species observed within each plot during a visit, then averaging across plots within each visit, followed by averaging across visits within the season. Overall species richness was calculated as a weighted average of seasonal values by the number of days in each season for each survey type. Species richness was compared among seasons within respective survey types for fixed-point bird use surveys.

Mean Use, Percent of Use, and Frequency of Occurrence

Mean use is the average number of birds observed per plot per survey for small or large birds. Small bird use (per 100-m plot per 5-min survey) and large bird use (per 800-m plot per 20-min survey) is calculated by: 1) summing birds per plot per visit, 2) averaging number of birds over plots within a visit, and 3) averaging number of birds across visits within a season. Overall mean use was calculated as a weighted average of seasonal values by the number of days in each season. *Percent of use* was calculated as the percentage of small or large bird use that was attributable to a particular bird type or species. *Frequency of occurrence* was calculated as the percent of surveys in which a particular bird type or species was observed.

Mean use and frequency of occurrence describe different aspects of relative abundance, in that mean use is based on the number of birds (i.e., large groups can produce high estimates), whereas frequency of occurrence is based on the number of groups (i.e., it is not influenced by group size). Qualitative comparisons were made with these metrics among bird types, seasons, and survey points to help one understand how birds are using the Project area over time and space.

Flight Height and Behavior

Flight height information was used to calculate the percentage of birds observed flying within the rotor-swept heights (RSH; estimated to be between 25 [82 ft] to 200 m above ground level for modern utility-scale turbines). The flight height recorded during the initial observation was used to calculate the percentage of birds flying within the RSH and mean flight height. The percentage of birds flying within the RSH at any time was calculated using the lowest and highest flight heights recorded. Auditory only observations were excluded from flight height calculations.

Spatial Use and Mapping

Spatial use in the Project was evaluated by comparing mean use by point location and qualitative review of flight paths. Flight paths of all eagles and federal and state-listed species were digitized and mapped in order to examine spatial patterns of use within the Project.

RESULTS

A total of 443 avian use surveys were completed between April 13, 2018 – March 7, 2019, resulting in 37 hours of survey effort for small birds, 148 hours of survey effort for large birds, and 443 hours of ECPG-level eagle use surveys. Details on the number of observations and groups recorded by species are presented in Appendix A, and details on mean use, percent of use, and frequency of occurrence are presented in Appendices B and C.

Small Bird Use

Eighty-one species (5,813 individual observations) were recorded during the small bird surveys (Appendix A1). The majority (99.1%) of small birds observed were passerines. Four species composed the majority (51.0%) of all small bird observations: red-winged blackbird (*Agelaius phoeniceus*; 16.1%), cliff swallow (*Petrochelidon pyrrhonota*; 15.6%), European starling (*Sturnus vulgaris*; 12.1%), and horned lark (*Eremophila alpestris*; 7.1%). Dickcissel (*Spiza americana*; 6.8%), American robin (*Turdus migratorius*; 3.8%), dark-eyed junco (*Junco hyemalis*; 3.6%), and brown-headed cowbird (*Molothrus ater*; 3.3%) were the next most commonly observed species. All other small bird species accounted for approximately 3.1% or fewer of the observations, individually.

Mean small bird use was highest during the summer (31.16 birds/100-m plot/5-min survey) followed by spring (12.39), fall (9.44), and winter (3.40; Table 2, Appendix B1). Higher use in the summer can be largely attributed to use by cliff swallow, red-winged blackbird, and dickcissel. Similarly, small bird species richness was highest during the summer (6.20 species/100-m plot/5-

min survey) compared to the spring (4.94), fall (1.04), and winter (0.42). Overall small bird species richness was 2.88 bird species/100-m plot/5-min survey.

Use by small birds was highest at survey Point 10 (35.3 birds/100-m plot/5-min survey), with European starling use being 27.8, and at Point 25 (32.2), with cliff swallow use being 15.67 (Appendix C1). Mean use across survey points ranged from 0.0 at points 37 and 40 to 35.3 at point 10.

Large Bird Use

Forty species (2,900 individual observations) were recorded during the large bird surveys (Appendix A2). The majority of large birds observed were waterfowl (34.9%) and shorebirds (33.1%). Four species composed the majority (66.9%) of all large bird observations: snow goose (*Chen caerulescens;* 28.4%) American golden-plover (*Pluvialis dominica*; 22.6%), mourning dove (*Zenaida macroura*; 9.6%), and killdeer (*Charadrius vociferus*; 6.3%). Turkey vulture (*Cathartes aura*; 5.6%) and greater white-fronted goose (*Anser albifrons;* 4.5%) were the next most commonly observed species. All other large bird species accounted for less than 3.6% of the observations, individually.

Mean large bird use was highest during the spring (11.14 birds/800-m plot/20-min survey), followed by winter (7.24), summer (5.35), and fall (3.47; Table 3, Appendix B2). Higher use in the spring can be largely attributed to higher use by American golden-plover. Large bird species richness was highest during the summer (1.99 species/800-m plot/20-min survey) compared to spring (1.36), fall (1.06), and winter (0.59). Overall large bird species richness was 1.20 bird species/800-m plot/20-min survey.

Use by large birds was highest at Point 32 (46.1 birds/800-m plot/20-min survey) due to higher use by waterfowl (41.67; Appendix C2). Waterfowl were also responsible for elevated mean use at Point 26(which had the second highest mean use) and Point 24 (which had the third highest mean use), with waterfowl use being 12.9 and 7.5 at those points, respectively (Appendix C2). Mean use per point ranged from 0.0 at points 38 and 40 to 46.1 at Point 32.

Diurnal Raptors

Eight diurnal raptor species (254 observations) were documented over the course of the 20-min large bird surveys (Appendix A2). Diurnal raptor use was highest during the summer (1.10 bird/800-m plot/20-min survey), followed by spring (0.64), fall (0.37), and winter (0.32; Table 3, Appendix B2). Red-tailed hawk (*Buteo jamaicensis*) had the highest overall use of any diurnal raptor (105 observations), followed by American kestrel (*Falco sparverius*; 97 observations) and Cooper's hawk (*Accipiter cooperii*; 24 observations; Appendix A2). Diurnal raptors accounted for 20.6% of large bird use in summer, 10.7% in fall, 5.7% in spring, and 4.4% in winter (Table 3). Diurnal raptor use at each observation point ranged from zero to 1.50 diurnal raptor/800-m plot/20-min survey, with highest use being recorded at points 36, 28, 29, and 15 (Appendix C2).

Table 2. Mean small bird use (number of birds/plot[a]/5-minute survey), percent of total use (%), and frequency of occurrence (%) for each bird type by season during the fixed-point bird use surveys at the proposed Lincoln Land Wind Project from April 13, 2018 − March 27, 2019.

Bird Flight Height and Behavior

During the 5-min small bird surveys, 422 groups of small birds were observed flying within the 100-m survey plot, totaling 3,041 observations (Table 4). During the 20-min large bird surveys, 316 groups of large birds were observed flying within the 800-m plot, totaling 2,111 observations (Table 5). Overall, 67.7% of flying large birds were observed within the RSH, 21.9% were below the RSH, and 10.4% were above the RSH. As a group, waterfowl had the highest percentage of observations recorded within the RSH (81.5%) followed by shorebirds (79.4%) and waterbirds (50.0%; Table 5).

Table 4. Group and individual observation estimated flight height characteristics for small birds by bird type[a] during 5-min fixed-point bird use surveys at the proposed Lincoln Land Wind Project from April 13, 2018 − March 27, 2019.

[a] 800-meter (m; 2,625-foot [ft]) radius plot for large birds.

[b] The likely rotor-swept height for potential collision with a turbine blade, or 25−200 m (82−656 ft) above ground level.

[c] Zeroes and NA values indicate the species was observed, but was not flying.

Obs = observations

Eagles

Eleven bald eagle observations and one golden eagle (*Aquila chrysaetos*) were recorded during the 60-min eagle use surveys and three bald eagle observations were recorded incidentally. Of the eagles documented during eagle use surveys, six bald eagle observations were in the winter (five adults and one juvenile, all observed in cropland) and five in the fall (three adults and two juveniles, all observed in cropland; Table 6). The golden eagle was observed in the spring (adult, observed in cropland with forest as secondary habitat). No eagles were observed during the breeding season for either species.

Ten bald eagle observations were within 800 m of the observer and below 200 m flight height (i.e., risk observations); these were recorded at seven of the 40 survey plots (Table 7, Figure 4). Twelve of the 27 bald eagle risk minutes (44%) were recorded at Points 10 and 11, both of which are located along Interstate 72 and suggest use may be related to food availability (roadkill) during winter (Table 7, Figure 4). Overall eagle observations were dispersed throughout the central to central-eastern portion of the Project boundary at relatively low levels, and no obvious eagle attractants were observed (Figure 4). The golden eagle was observed at Point 14 and accounted for 12 eagle risk minutes, resulting in 0.17 golden eagle observations/hour and <0.03 golden eagle risk minutes/hour of observation.

Table 6. Number of bald eagle observations recorded within 800 meters (2,625 feet) of the observer during eagle use surveys at the proposed Lincoln Land Wind Project from April 13, 2018 – March 27, 2019.

Sensitive Species

No federally threatened or endangered bird species were observed during the surveys. Four state-listed species were observed during surveys and or/incidentally: northern harrier (endangered, n=31 [14 incidental]), upland sandpiper (endangered, n=1), short-eared owl (endangered, n=4 [all incidental]), and black-billed cuckoo (threatened, n=4). Northern harrier observations were evenly distributed across the Project and most often were seen hunting along agricultural swales (Figure 5). The upland sandpiper (*Bartramia longicauda*) was recorded on May 29, 2018, and the short-eared owls (*Asio flammeus*) were recorded on January 16, 2019 (Figure 5). Observations of the black-billed cuckoo (*Coccyzus erythropthalmus*) were recorded on the western side of the Project in forested/shrub-scrub riparian areas (Figure 5). In addition, four birds of particular concern identified by the IPaC report were observed in the Project area during surveys: American golden plover, bobolink *(Dolichonyx oryzivorus*), Henslow's sparrow (*Ammodramus henslowii*), and red-headed woodpecker (*Melanerpes erythrocephalus*; Table 8, Appendix D; USFWS 2019).

Table 8. Summary of group and individual observations of state-listed species and birds of particular concern observed during fixed-point surveys and as incidental wildlife observations at the proposed Lincoln Land Wind Project, Morgan County, Illinois from April 13, 2018 – March 27, 2019

FIGURE REMOVED – SENSITIVE SPECIES LOCATIONS

Figure 5. Flight paths and perch locations of state-listed species observed during surveys conducted at the proposed Lincoln Land Wind Project from April 13, 2018 – March 27, 2019.

DISCUSSION

Small Birds

Passerines composed the majority (99.1%) of small bird observations. The most commonly observed small birds included red-winged blackbird, cliff swallow, European starling, and horned lark. In general, the species observed are locally abundant and observations seem to reflect a species composition that is typical of agricultural fields in Illinois (Walk et al. 2010). Cliff swallows are not commonly found in agricultural fields, but their numbers have been dramatically increasing in Illinois over the past two decades, and the species is often associated with anthropogenic structures, such as bridges, that act as artificial cliff sides (Walk et al. 2010, Kleen et al 2004, Johnson et al 2018). Wind facilities appear to account for only a small fraction of overall bird mortality (Erickson et al 2014). Together, this suggests the Project will likely have little impact on regional small bird populations or sensitive small bird species populations.

Large Birds

Large bird species most often observed during the large bird surveys included snow goose, American golden-plover, mourning dove, and killdeer, species generally typical of agricultural fields in Illinois (Kleen et al 2004, eBird 2019). The American golden-plover, a bird of particular concern, was recorded in large numbers in the Project area during migration, the only time of year that this species is expected to occur given that it breeds in northern Canada (Johnson et al. 2018). In general, shorebirds represent a small number of fatalities at wind turbines (Erickson et al. 2014), and considering that there is only one publicly available record of an American golden plover fatality from an operating wind farm in the Midwest (Appendix F), it is unlikely the Project will significantly affect this species' population. Many of the remaining large bird observations were species found commonly in agricultural fields in the area, and it is unlikely the Project will affect these species populations substantially.

Diurnal Raptors

Annual mean diurnal raptor use in the Project area (0.59 raptor/800-m plot/20-min survey) was compared with 48 other wind energy facilities that implemented similar protocols and had data for three or four seasons. The annual mean raptor use at these 48 wind energy facilities ranged from 0.06−2.34 (Figure 5). A relative ranking of annual mean raptor use was developed based on the results from these 48 wind energy facilities as low (zero to 0.5), low to moderate (0.5–1.0), moderate (1.0–2.0), high (2.0–3.0), and very high (more than 3.0). Under this ranking, annual mean diurnal raptor use at the Project (0.59 raptor/800-m plot/20-min survey) is considered to be low to moderate. Raptor fatality rates at the Project will likely be similar to rates reported at other wind energy facilities in the Midwest, ranging from zero to 0.47 raptor fatality per megawatt per year (Appendix E).

Eagles

Adult and juvenile bald eagles were recorded in the Project area during fall and winter. Due to their absence in the spring and summer, it is likely these eagles are opportunistically foraging or

migrating, and not breeding in the Project area. The nearest likely location of concentrated bald eagle activity is the Illinois River, located approximately 26 mi west of the Project. There are relatively few publicly available records of bald eagles colliding with wind turbines over the species' entire range (best publicly available estimate is 49 total; Kritz et al. 2018) and over the entire history of the wind energy industry, despite this species' large and increasing population, and widespread distribution across North America (Buehler 2000, Erickson et al. 2002, Smallwood and Karas 2009, US Department of Agriculture Rural Utilities Service and US Department of Energy Western Area Power Administration 2010, Allison 2012, Pagel et al. 2013).

The golden eagle was observed on the western edge of the Project and appeared to be migrating based on the seasonal timing of this observation (April 2018; Kochert et al 2002), as well as the orientation of its overall flight path (from southeast to northwest). Because golden eagles are not known to breed in the area, this spring observation is unlikely to indicate nearby nesting, and most likely represents a wandering golden eagle during migration (Kleen et al 2004). The Project lacks terrain features, such as cliffs (typically used for nesting), and prey sources (such as jackrabbits [*Lepus* spp.] and prairie dogs [*Cynomys* spp.]) that would be likely to consistently concentrate golden eagle activity during migration. In the future, golden eagles may continue to be present briefly in the Project during migration; however, turbine operation is not expected to impact golden eagle populations due to the expected low use.

Sensitive Species

State-Listed Species

State-endangered species observed included upland sandpiper, short-eared owl, and northern harrier. All of these species are grassland-obligates and have seen a notable habitat decline in Illinois (Iverson 1988; Walk et al. 2010); however, grassland is very rare within the Project (less than 3.3% if you include hay/pasture and herbaceous land covers, with hay and pasture likely to be disturbed). Northern harrier observations were distributed across the Project area, and were frequently observed flying low (below 10 m [33ft]) while hunting over agricultural swales and grassy strips. No publicly available northern harrier fatalities have been reported in the Midwest (Appendix F), which is likely due to low elevation flight for hunting. This behavior is common among harriers and short-eared owls. Northern harriers were not observed in the Project during May through July, suggesting that they do not breed in the Project area. Similarly, short-eared owls were only observed outside of the breeding season and are not known to breed in the vicinity of the Project (Kleen et al. 2004, Johnson et al. 2018).

One upland sandpiper was observed in the central-eastern area of the Project, moving between grassland and cropland. Upland sandpipers prefer native prairie habitat, little of which remains across Illinois, and with limited high-quality habitat available nesting has the potential to occur in hayfields, pastures, ditches, agricultural swales, and grasses adjacent to developed areas (INHS 2019, USDA Forest Service 2003). Breeding upland sandpipers have been recorded in Morgan County where the Project is located (INHS 2019, Kleen et al 2004). To date, eighteen upland sandpiper fatalities have been recorded at modern wind facilities across North America, 11 of

which were reported from the Midwest. None of these were reported from Illinois facilities (Appendix F).

Grassland-obligate northern harriers, upland sandpipers, and short-eared owls tend to fly low, and are not likely to be commonly found in the rotor-swept zone of operational turbines. Ground-based construction activities are, therefore, more likely to disturb nesting birds than turbine operation. Because turbine construction will be focused primarily in agricultural fields, it is unlikely that Project construction will cause substantial disturbance to these species.

One state-threatened bird species, the black-billed cuckoo, was observed during surveys. Black-billed cuckoos were seen perched and/or flying in the middle-western portion of the Project at points 17 and 21 in forested riparian areas, land cover types consistent with their preferred breeding habitat (Kleen et al. 2004). To date, 38 black-billed cuckoo fatalities have been reported at wind facilities in North America; of these, six were reported in the Midwest (Appendix F). Four black-billed cuckoo fatalities have been observed in Illinois to-date (Keith Shank, Illinois DNR, pers. comm. May 2018). Given their presence within the Project and their reported fatalities, it is possible black-billed cuckoos could collide with turbines, but turbine operation is not expected to impact black-billed cuckoo populations.

Birds of Particular Concern

Four species listed as birds of particular concern by the IPaC were observed in the Project, including American golden-plover, red-headed woodpecker, Henslow's sparrow, and bobolink (USFWS 2019). American golden-plovers were observed only during migration, and their abundance suggests they may regularly use the Project area as a stopover site. Red-headed woodpeckers may nest on site in small woodlots or in telephone poles, and limited breeding habitat for bobolinks exists in the form of hayfields/pasture. Henslow's sparrow prefers weedy fields and are ground-nesters. Documented fatalities at wind energy facilities in the Midwest are very low for all birds of particular concern observed in the Project: American golden-plover (1 fatality), red-headed woodpecker (1 fatality), bobolink (3 fatalities), and Henslow's sparrow (1 fatality; Appendix F).

CONCLUSION

Analyses of the data collected during the surveys generally indicates development of the Project is likely to have low to moderate impacts on small and large bird populations, including diurnal raptors and sensitive species. In general, the most common species observed are widespread and abundant, suggesting relatively low risk of adverse impacts to bird populations.

All eagle observations were outside of the breeding season and there appear to be no landscape features or prey concentrations within the Project area that would concentrate eagles.

State-endangered northern harriers are abundant in the Project during much of the year; however, they were not observed during the breeding season, and likely nest outside the Project. Nesting habitat for this species is unlikely to be impacted, and their typical low-elevation flight behavior

likely precludes them from collision with turbines. Similar to northern harriers, state-endangered short-eared owls were observed in the Project in winter and breeding populations are not likely to be impacted. The upland sandpiper and black-billed cuckoo are unlikely to be impacted during operations but may warrant management consideration, such as avoiding breeding-season disturbance to suitable nesting habitat during construction phase to avoid potential impacts to nesting individuals.

Appendix D. US Fish and Wildlife Service Information, Planning and Consultation System Resource List

IPaC resource list

This report is an automatically generated list of species and other resources such as critical habitat (collectively referred to as *trust resources*) under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the USFWS office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

Location

Morgan County, Illinois

Local office

Southern Illinois Sub-Office

- (618) 997-3344
- (618) 997-8961

Marion Illinois Sub-office
8588 Route 148
Marion, IL 62959-5822

http://www.fws.gov/midwest/Endangered/section7/s7process/step1.html

NOT FOR CONSULTATION

Endangered species

This resource list is for informational purposes only and does not constitute an analysis of project level impacts.

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population, even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

1. Draw the project location and click CONTINUE.
2. Click DEFINE PROJECT.
3. Log in (if directed to do so).
4. Provide a name and description for your project.
5. Click REQUEST SPECIES LIST.

Listed species

[1] and their critical habitats are managed by the Ecological Services Program of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries).[2]

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact NOAA Fisheries for species under their jurisdiction.

1. Species listed under the Endangered Species Act are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the listing status page for more information.
2. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

The following species are potentially affected by activities in this location:

Mammals

NAME	STATUS
Indiana Bat Myotis sodalis There is **final** critical habitat for this species. Your location is outside the critical habitat. https://ecos.fws.gov/ecp/species/5949	Endangered
Northern Long-eared Bat Myotis septentrionalis No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/9045	Threatened

Flowering Plants

NAME	STATUS
Decurrent False Aster Boltonia decurrens No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/7705	Threatened

Critical habitats

Potential effects to critical habitat(s) in this location must be analyzed along with the endangered species themselves.

THERE ARE NO CRITICAL HABITATS AT THIS LOCATION.

NOT FOR CONSULTATION

Migratory birds

Certain birds are protected under the Migratory Bird Treaty Act[1] and the Bald and Golden Eagle Protection Act[2].

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.

Additional information can be found using the following links:

- Birds of Conservation Concern http://www.fws.gov/birds/management/managed-species/birds-of-conservation-concern.php
- Measures for avoiding and minimizing impacts to birds http://www.fws.gov/birds/management/project-assessment-tools-and-guidance/conservation-measures.php

- Nationwide conservation measures for birds

The birds listed below are birds of particular concern either because they occur on the USFWS Birds of Conservation Concern (BCC) list or warrant special attention in your project location. To learn more about the levels of concern for birds on your list and how this list is generated, see the FAQ below. This is not a list of every bird you may find in this location, nor a guarantee that every bird on this list will be found in your project area. To see exact locations of where birders and the general public have sighted birds in and around your project area, visit the E-bird data mapping tool (Tip: enter your location, desired date range and a species on your list). For projects that occur off the Atlantic Coast, additional maps and models detailing the relative occurrence and abundance of bird species on your list are available. Links to additional information about Atlantic Coast birds, and other important information about your migratory bird list, including how to properly interpret and use your migratory bird report, can be found below.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, click on the PROBABILITY OF PRESENCE SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NAME	BREEDING SEASON (IF A BREEDING SEASON IS INDICATED FOR A BIRD ON YOUR LIST, THE BIRD MAY BREED IN YOUR PROJECT AREA SOMETIME WITHIN THE TIMEFRAME SPECIFIED, WHICH IS AVERY LIBERAL ESTIMATE OF THE DATES INSIDE WHICH THE BIRD BREEDS ACROSS ITS ENTIRE RANGE. "BREEDS ELSEWHERE" INDICATES THAT THE BIRD DOES NOT LIKELY BREED IN YOUR PROJECT AREA.)
American Bittern Botaurus lentiginosus This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA https://ecos.fws.gov/ecp/species/6582	Breeds Apr 1 to Aug 31
American Golden-plover Pluvialis dominica This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds elsewhere
Bald Eagle Haliaeetus leucocephalus This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. https://ecos.fws.gov/ecp/species/1626	Breeds Oct 15 to Aug 31

Black-billed Cuckoo Coccyzus erythropthalmus — Breeds May 15 to Oct 10

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9399

Bobolink Dolichonyx oryzivorus — Breeds May 20 to Jul 31

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Buff-breasted Sandpiper Calidris subruficollis — Breeds elsewhere

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9488

Cerulean Warbler Dendroica cerulea — Breeds Apr 21 to Jul 20

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/2974

Dunlin Calidris alpina arcticola — Breeds elsewhere

This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA

Eastern Whip-poor-will Antrostomus vociferus — Breeds May 1 to Aug 20

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Henslow's Sparrow Ammodramus henslowii — Breeds May 1 to Aug 31

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/3941

Hudsonian Godwit Limosa haemastica — Breeds elsewhere

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Kentucky Warbler Oporornis formosus — Breeds Apr 20 to Aug 20

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Lesser Yellowlegs Tringa flavipes — Breeds elsewhere

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9679

NOT FOR CONSULTATION

	Breeds Apr 1 to Jul 31
Prothonotary Warbler Protonotaria citrea This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds May 10 to Sep 10
Red-headed Woodpecker Melanerpes erythrocephalus This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds elsewhere
Ruddy Turnstone Arenaria interpres morinella This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA	Breeds elsewhere
Rusty Blackbird Euphagus carolinus This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds elsewhere
Semipalmated Sandpiper Calidris pusilla This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds elsewhere
Short-billed Dowitcher Limnodromus griseus This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9480	Breeds elsewhere
Smith's Longspur Calcarius pictus This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA	Breeds May 10 to Aug 31
Wood Thrush Hylocichla mustelina This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	

Tell me more about conservation measures I can implement to avoid or minimize impacts to migratory birds.

Nationwide Conservation Measures describes measures that can help avoid and minimize impacts to all birds at any location year round. Implementation of these measures is particularly important when birds are most likely to occur in the project area. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is a very helpful impact minimization measure. To see when birds are most likely to occur and be breeding in your project area, view the Probability of Presence Summary. Additional measures and/or permits may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

What does IPaC use to generate the migratory birds potentially occurring in my specified location?

The Migratory Bird Resource List is comprised of USFWS Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the AKN Phenology Tool.

What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?

The probability of presence graphs associated with your migratory bird list are based on data provided by the Avian Knowledge Network (AKN). This data is derived from a growing collection of survey, banding, and citizen science datasets .

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go the Probability of Presence Summary and then click on the"Tell me about these graphs" link.

How do I know if a bird is breeding, wintering, migrating or present year-round in my project area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating or year-round), you may refer to the following resources: The Cornell Lab of Ornithology All About Birds Bird Guide, or (if you are unsuccessful in locating the bird of interest there) the Cornell Lab of Ornithology Neotropical Birds guide. If a bird on your migratory bird species list has a breeding season associated with it, if that bird does occur in your project area, there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

What are the levels of concern for migratory birds?

Migratory birds delivered through IPaC fall into the following distinct categories of concern:

1. "BCC Rangewide" birds are Birds of Conservation Concern (BCC) that are of concern throughout their range anywhere within the USA (including Hawaii, the Pacific Islands, Puerto Rico, and the Virgin Islands);
2. "BCC - BCR" birds are BCCs that are of concern only in particular Bird Conservation Regions (BCRs) in the continental USA; and
3. "Non-BCC - Vulnerable" birds are not BCC species in your project area, but appear on your list either because of the Eagle Act requirements (for eagles) or (for non-eagles) potential susceptibilities in offshore areas from certain types of development or activities (e.g. offshore energy development or longline fishing).

Although it is important to try to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially eagles and BCC species of rangewide concern. For more information on conservation measures you can implement to help avoid and minimize migratory bird impacts and requirements for eagles, please see the FAQs for these topics.

Details about birds that are potentially affected by offshore projects

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the Northeast Ocean Data Portal. The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review. Alternately, you may download the bird model results files underlying the portal maps through the NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and Abundance on the Atlantic Outer Continental Shelf project webpage.

NOT FOR CONSULTATION

Bird tracking data can also provide additional details about occurrence and habitat use throughout the year, including migration. Models relying on survey data may not include this information. For additional information on marine bird tracking data, see the Diving Bird Study and the nanotag studies or contact Caleb Spiegel or Pam Loring.

What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to obtain a permit to avoid violating the Eagle Act should such impacts occur.

Proper Interpretation and Use of Your Migratory Bird Report

The migratory bird list generated is not a list of all birds in your project area, only a subset of birds of priority concern. To learn more about how your list is generated, and see options for identifying what other birds may be in your project area, please see the FAQ "What does IPaC use to generate the migratory birds potentially occurring in my specified location". Please be aware this report provides the "probability of presence" of birds within the 10 km grid cell(s) that overlap your project; not your exact project footprint. On the graphs provided, please also look carefully at the survey effort (indicated by the black vertical bar) and for the existence of the "no data" indicator (a red horizontal bar). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort bar or no data bar means a lack of data and, therefore, a lack of certainty about presence of the species. This list is not perfect; it is simply a starting point for identifying what birds of concern have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list helps you know what to look for to confirm presence, and helps guide you in knowing when to implement conservation measures to avoid or minimize potential impacts from your project activities, should presence be confirmed. To learn more about conservation measures, visit the FAQ "Tell me about conservation measures I can implement to avoid or minimize impacts to migratory birds" at the bottom of your migratory bird trust resources page.

Facilities

National Wildlife Refuge lands

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

This location overlaps the following National Wildlife Refuge lands:

LAND	ACRES
Illinois River National Wildlife And Fish Refuges	3,698.37 acres

- (309) 535-2290
- (309) 535-3023

19031 East County Road 2110n
Havana, IL 62644-6372

https://www.fws.gov/refuges/profiles/index.cfm?id=33653

Fish hatcheries

THERE ARE NO FISH HATCHERIES AT THIS LOCATION.

Wetlands in the National Wetlands Inventory

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

WETLAND INFORMATION IS NOT AVAILABLE AT THIS TIME

This can happen when the National Wetlands Inventory (NWI) map service is unavailable, or for very large projects that intersect many wetland areas. Try again, or visit the NWI mapper to view wetlands at this location.

NOT FOR CONSULTATION

Data limitations

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

Data exclusions

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

Data precautions

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate federal, state, or

local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

Appendix E. Raptor Fatality Summary Table for the Midwest Region of North America

Appendix E. Wind energy facilities in the Midwest region of North America with comparable use and fatality data for diurnal raptors. Use estimate presented as number of diurnal raptor observations per 800-meter (2, 625-foot) plot per 20-minute survey. Diurnal raptor fatality estimate is number of fatalities per megawatt (MW) per year.

March 2006.

Chatfield, A., W. Erickson, and K. Bay. 2009. Avian and Bat Fatality Study, Dillon Wind-Energy Facility, Riverside County, California. Final Report: March 26, 2008 - March 26, 2009. Prepared for Iberdrola Renewables, Portland, Oregon. Prepared by Western EcoSystems Technology, Inc. (WEST), Cheyenne, Wyoming. June 3, 2009.

Chatfield, A., W. P. Erickson, and K. Bay. 2010a. Avian and Bat Fatality Study at the Alite Wind-Energy Facility, Kern County, California. Final Report: June 15, 2009 – June 15, 2010. Prepared for CH2M HILL, Oakland, California. Prepared by Western EcoSystems Technology, Inc. (WEST), Cheyenne, Wyoming.

Chatfield, A., W. P. Erickson, and K. Bay. 2010b. Avian Baseline Studies at the Sun Creek Wind Resource Area, Kern County, California. Final Report: May 2009 - May 2010. Prepared for CH2M HILL, Oakland, California. Prepared by Western EcoSystems Technology, Inc., Cheyenne, Wyoming. September 30, 2010. Available online: https://www.kerncounty.com/planning/pdfs/eirs/AltaEast/Appendices/ApD/D3%20Avian%20Baseline%20Studies%202010.pdf

Chatfield, A., W. P. Erickson, and K. Bay. 2011. Avian Baseline Studies at the Alta East Wind Resource Area, Kern County, California. Final Report: July 10, 2010 - June 1, 2011. Prepared for CH2M HILL, Oakland, California. Prepared by Western EcoSystems Technology, Inc., Cheyenne, Wyoming. July 13, 2011. Appendix D-8. *In:* Bureau of Land Management (BLM). 2013. Alta East Wind Project: Proposed Plan Amendment and Final Environmental Impact Statement. CACA #0052537. US Department of the Interior BLM. February 2013. Available online: http://www.blm.gov/ca/st/en/fo/ridgecrest/alta_east_wind_project.html; 2011 Avian Baseline Report (Appendix D-8) available online at: http://www.blm.gov/pgdata/etc/medialib/blm/ca/pdf/ridgecrest/alta_east_wind.Par.22191.File.dat/D8%20Avian%20Baseline%20Studies%202011.pdf

Chatfield, A., M. Sonnenberg, and K. Bay. 2012. Avian and Bat Mortality Monitoring at the Alta-Oak Creek Mojave Project, Kern County, California. Final Report for the First Year of Operation March 22, 2011 – June 15, 2012. Prepared for Alta Windpower Development, LLC, Mojave, California. Prepared by Western EcoSystems Technology, Inc. (WEST), Cheyenne, Wyoming. September 12, 2012.

Chatfield, A. and D. Russo. 2014. Post-Construction Avian and Bat Fatality Monitoring for the Pinyon Pines I & II Wind Energy Project, Kern County, California. Final Report for the First Year of Operation: March 2013 - March 2014. Prepared for MidAmerican Renewables, LLC, Des Moines, Iowa, and Alta Windpower Development, LLC, Mojave, California. Prepared by Western EcoSystems Technology, Inc. (WEST), Cheyenne, Wyoming. July 28, 2014.

Chatfield, A. and K. Bay. 2014. Post-Construction Studies for the Mustang Hills and Alta VIII Wind Energy Facilities, Kern County, California. Final Report for the First Year of Operation: July 2012 - October 2013. Prepared for EverPower Wind Holdings, Inc. and Brookfield Renewable Energy Group. Prepared by Western EcoSystems Technology, Inc. (WEST), Cheyenne, Wyoming. February 28, 2014.

Chatfield, A., D. Riser-Espinoza, and K. Bay. 2014. Bird and Bat Mortality Monitoring at the Alta Wind Energy Center, Phases I - V, Kern County, California. Final Report for the Second Year of Operation: March 4, 2013 – March 6, 2014. Prepared for Alta Windpower Development, LLC, Mojave, California. Prepared by Western EcoSystems Technology, Inc. (WEST), Cheyenne, Wyoming. August 22, 2014.

Chatfield, A., K. Levenstein, and G. DiDonato. 2015. Post-Construction Avian and Bat Mortality Monitoring, Alta X, LLC, Kern County, California. Final Report for the First Year of Operation: March 2014 - March 2015. Prepared for Alta Wind X, LLC, Mojave, California. Prepared by Western EcoSystems Technology, Inc. (WEST), Cheyenne, Wyoming. July 10, 2015.

Chatfield, A., T. Rintz, and R. Clark. 2018. Post-Construction Avian and Bat Fatality Monitoring at the Rising Tree and Addison Wind Energy Projects, Kern County, California. Year 2 Final Report: June 2017 – June 2018. Prepared for EDP Renewables North America, LLC (EDPR), Houston, Texas. Prepared by Western EcoSystems Technology, Inc. (WEST), Corvallis, Oregon. August 20, 2018. 35 pp. + appendices.

Chodachek, K., C. Derby, M. Sonnenberg, and T. Thorn. 2012. Post-Construction Fatality Surveys for the Pioneer Prairie Wind Farm I LLC Phase II, Mitchell County, Iowa: April 4, 2011 – March 31, 2012. Prepared for EDP Renewables, North America LLC, Houston, Texas. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota. August 27, 2012.

Chodachek, K., C. Derby, K. Adachi, and T. Thorn. 2014. Post-Construction Fatality Surveys for the Pioneer Prairie II Wind Energy Facility, Mitchell County, Iowa. Final Report: July 1 - October 18, 2013. Prepared for EDP Renewables, North America LLC, Houston, Texas. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota. April 2014.

Chodachek, K., K. Adachi, and G. DiDonato. 2015. Post Construction Fatality Surveys for the Prairie Rose Wind Energy Facility, Rock County, Minnesota. Final Report: April 15 to June 13, 2014, and August 15 to October 29, 2014. Prepared for Enel Green Power, North America, San Diego, California. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota. January 23, 2015. Available online: https://www.edockets.state.mn.us/EFiling/edockets/searchDocuments.do?method=showPoup&documentId=%7BF38C2FEC-ED84-4813-AF3E-5A397A954A34%7D&documentTitle=20152-107006-01

Chodachek, K. and Z. Gustafson. 2018. Tier 4 Post-Construction Mortality Monitoring Study for the Odell Wind Energy Project, Cottonwood and Jackson Counties, Minnesota. Final Fatality Report: December 2016 – December 2017. Prepared for Odell Wind Farm, LLC, Oakville, Ontario, Canada. Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota. March 15, 2018. Available online: https://www.edockets.state.mn.us/EFiling/edockets/searchDocuments.do?method=showPoup&documentId={E0912A62-0000-C93E-88EA-844E240F695B}&documentTitle=20183-141067-02

Cole Engineering Group Ltd. 2017. St. Columban Wind Project Post-Construction Bird and Bat Mortality Monitoring – 2016 Year-End Report. In support of REA 7042-96FQB7. Cole Engineering Group Ltd., Markham, Ontario. February 2017.

Derby, C., A. Dahl, W. Erickson, K. Bay, and J. Hoban. 2007. Post-Construction Monitoring Report for Avian and Bat Mortality at the Nppd Ainsworth Wind Farm. Prepared for the for the Nebraska Public Power District, Columbus, Nebraska. Prepared by Western EcoSystems Technology, Inc. (WEST), Cheyenne, Wyoming. February 27, 2007. Available online: https://tethys.pnnl.gov/sites/default/files/publications/Avian%20&%20Bat%20Mortiality%20at%20the%20NPPD%20Ainsworth%20Wind%20Farm.pdf

Derby, C., A. Dahl, K. Taylor, K. Bay, and K. Seginak. 2008. Wildlife Baseline Studies for the Wessington Springs Wind Resource Area, Jerauld County, South Dakota, March 2007-November 2007. Technical report prepared for Power Engineers, Inc. and Babcock and Brown Renewable Holdings, Inc. by Western EcoSystems Technology, Inc. (WEST).

Derby, C. and A. Dahl. 2009. Wildlife Studies for the Bitter Root Wind Resource Area, Yellow, Medicine, and Lincoln Counties, Minnesota. Annual Report: March 25, 2008 - October 8, 2008. Prepared for Buffalo Ridge Power Partners, Argyle, New York. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismark, North Dakota. April 16, 2009. *In:* Minnesota Department of Commerce, Office of Energy Security. 2010. Bitter Root Wind Farm Project, Environmental Report. Site Permit Application, Appendix F. Minnesota Public Utilities Commission, Docket 25538. March 2010. April 16, 2009. Derby, C., K. Bay, and J. Ritzert. 2009. Bird Use Monitoring, Grand Ridge Wind Resource Area, La Salle County, Illinois. Year One Final Report, March 2008 - February 2009. Prepared for Grand Ridge Energy LLC, Chicago, Illinois. Prepared by Western EcoSystems Technology, Inc. (WEST), Cheyenne, Wyoming. July 29, 2009.

Derby, C., J. Ritzert, and K. Bay. 2010a. Bird and Bat Fatality Study, Grand Ridge Wind Resource Area, Lasalle County, Illinois. January 2009 - January 2010. Prepared for Grand Ridge Energy LLC, Chicago, Illinois. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota. July 13, 2010. Revised January 2011.

Derby, C., K. Chodachek, and K. Bay. 2010b. Post-Construction Bat and Bird Fatality Study Crystal Lake II Wind Energy Center, Hancock and Winnebago Counties, Iowa. Final Report: April 2009- October 2009. Prepared for NextEra Energy Resources, Juno Beach, Florida. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota. June 2, 2010.

Derby, C., K. Bay, and A. Dahl. 2010c. Wildlife Studies for the Prairiewinds Sd1 Crow Lake Wind Resource Area, Jerauld, Brule, and Aurora Counties, South Dakota. Final Report: March 2009 – February 2010. Prepared for Basin Electric Power Cooperative, Bismarck, North Dakota. Prepared by Western EcoSystems Technolgy, Inc. (WEST), Bismarck, North Dakota. August 3, 2010.

Derby, C., A. Dahl, A. Merrill, and K. Bay. 2010d. 2009 Post-Construction Monitoring Results for the Wessington Springs Wind-Energy Facility, South Dakota. Final Report. Prepared for Wessington Wind Energy Center, LLC, Juno Beach, Florida. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota. August 19, 2010.

Derby, C., K. Chodachek, K. Bay, and A. Merrill. 2010e. Post-Construction Fatality Survey for the Buffalo Ridge I Wind Project. May 2009 - May 2010. Prepared for Iberdrola Renewables, Inc., Portland, Oregon. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota.

Derby, C., K. Chodachek, K. Bay, and A. Merrill. 2010f. Post-Construction Fatality Surveys for the Elm Creek Wind Project: March 2009- February 2010. Prepared for Iberdrola Renewables, Inc. (IRI), Portland, Oregon. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota.

Derby, C., K. Chodachek, K. Bay, and A. Merrill. 2010g. Post-Construction Fatality Surveys for the Moraine II Wind Project: March - December 2009. Prepared for Iberdrola Renewables, Inc. (IRI), Portland, Oregon. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota.

Derby, C., A. Dahl, K. Bay, and L. McManus. 2011a. 2010 Post-Construction Monitoring Results for the Wessington Springs Wind Energy Facility, South Dakota. Final Report: March 9 – November 16, 2010. Prepared for Wessington Wind Energy Center, LLC, Juno Beach, Florida. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota. November 22, 2011.

Derby, C., K. Chodachek, K. Bay, and S. Nomani. 2011b. Post-Construction Fatality Surveys for the Barton I and II Wind Project: Iri. March 2010 - February 2011. Prepared for Iberdrola Renewables, Inc. (IRI), Portland, Oregon. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota. Version: September 28, 2011.

Derby, C., K. Chodachek, K. Bay, and S. Nomani. 2011c. Post-Construction Fatality Surveys for the Rugby Wind Project: Iberdrola Renewables, Inc. March 2010 - March 2011. Prepared for Iberdrola Renewables, Inc. (IRI), Portland, Oregon. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota. Version: October 14, 2011.

Derby, C., K. Chodachek, T. Thorn, K. Bay, and S. Nomani. 2011d. Post-Construction Fatality Surveys for the Prairiewinds Nd1 Wind Facility, Basin Electric Power Cooperative, March - November 2010. Prepared for Basin Electric Power Cooperative, Bismarck, North Dakota. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota. August 2, 2011.

Derby, C., K. Chodachek, and M. Sonnenberg. 2012a. Post-Construction Casualty Surveys for the Buffalo Ridge II Wind Project. Iberdrola Renewables: March 2011- February 2012. Prepared for Iberdrola Renewables, LLC, Portland, Oregon. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota. August 31, 2012.

Derby, C., K. Chodachek, and M. Sonnenberg. 2012b. Post-Construction Fatality Surveys for the Elm Creek II Wind Project. Iberdrola Renewables: March 2011-February 2012. Prepared for Iberdrola Renewables, LLC, Portland, Oregon. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota. October 8, 2012.

Derby, C., A. Dahl, and A. Merrill. 2012c. Post-Construction Monitoring Results for the Prairiewinds Sd1 Wind Energy Facility, South Dakota. Final Report: March 2011 - February 2012. Prepared for Basin Electric Power Cooperative, Bismarck, North Dakota. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota. September 27, 2012.

Derby, C., K. Chodachek, T. Thorn, and A. Merrill. 2012d. Post-Construction Surveys for the Prairiewinds Nd1 (2011) Wind Facility Basin Electric Power Cooperative: March - October 2011. Prepared for Basin Electric Power Cooperative, Bismarck, North Dakota. Prepared by Western Ecosystems Technology, Inc. (WEST), Bismarck, North Dakota. August 31, 2012.

Derby, C., A. Dahl, and D. Fox. 2013a. Post-Construction Fatality Monitoring Studies for the Prairiewinds Sd1 Wind Energy Facility, South Dakota. Final Report: March 2012 - February 2013. Prepared for Basin Electric Power Cooperative, Bismarck, North Dakota. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota. November 13, 2013.

Derby, C., G. Iskali, S. Howlin, T. Thorn, T. Lyon, and A. Dahl. 2013b. Post-Construction Monitoring Results for the Big Smile Wind Farm, Roger Mills County, Oklahoma. Final Report: March 2012 to February 2013. Prepared for Acciona Wind Energy, Chicago, Illinois. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota. June 12, 2013.

Derby, C., G. Iskali, M. Kauffman, T. Thorn, T. Lyon, and A. Dahl. 2013c. Post-Construction Monitoring Results, Red Hills Wind Farm, Roger Mills and Custer Counties, Oklahoma. Final Report: March 2012 to March 2013. Prepared for Acciona Wind Energy, Chicago, Illinois. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota. June 12, 2013.

Derby, C. and T. Thorn. 2014. Avian Use Surveys for the Sunflower Wind Project, Morton and Stark Counties, North Dakota. Final Report: March 2013 through February 2014. Prepared for Sunflower Wind Project, LLC, Santa Barbara, California. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota. May 22, 2014.

Derby, C., A. Dahl, and G. DiDonato. 2014. Post-Construction Fatality Monitoring Studies for the Prairiewinds Sd1 Wind Energy Facility, South Dakota. Final Report: March 2013 - February 2014. Prepared for Basin Electric Power Cooperative, Bismarck, North Dakota. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota.

Derby, C., D. Klostermeier, R. Tupling, and K. Moratz. 2018. Post-Construction Bird and Bat Fatality Monitoring for the Thunder Spirit Wind Energy Facility, Adams County, North Dakota. Final Fatality Report. Prepared for Thunder Spirit Wind, LLC, Bismarck, North Dakota. Prepared by Western EcoSystems Technology, Inc. (WEST), Bismarck, North Dakota. March 1, 2018.

INTRODUCTION

Western EcoSystems Technology, Inc. (WEST) completed ground-based follow-up observations at potential bald eagle nests at the proposed Lincoln Land Wind Project (Project) in Morgan County, Illinois. The purpose of this survey was to determine the status of two nests that were identified as potential bald eagle (*Haliaeetus leucocephalus*) nests during initial aerial surveys completed for the Project.

METHODS

An initial aerial raptor nest survey was completed for the Project on April 8, 2018 by Copperhead Environmental Consultants (Copperhead 2018). On May 9 and 10, 2018, WEST completed ground-based follow-up observations of two potential bald eagle nests (Nests 1 and 19) identified as unknown occupancy during the aerial survey. Observations were completed more than 30 days after the initial aerial surveys, and each nest was observed for four hours. This approach is consistent with the U.S. Fish and Wildlife Service (USFWS) *Eagle Conservation Plan Guidance* (USFWS 2013) and December 2016 revisions to the guidance (USFWS 2016), which describe methods for determining occupancy status of eagle nests.

Nests were classified as occupied if any of the following were observed at the nest structure: 1) an adult in an incubating position, 2) eggs, 3) nestlings or fledglings, 4) a pair of adults, 5) a newly constructed or refurbished stick nest in the area where territorial behavior of a raptor had been observed earlier in the breeding season, or 6) a recently repaired nest with fresh sticks (clean breaks) or fresh boughs on top, and/or droppings and/or molted feathers on its rim or underneath. Occupied nests were further classified as active if: 1) an adult was present on the nest in incubating position, 2) an egg or eggs were present, or 3) nestlings were observed. Nests were classified as inactive if no eggs or chicks were present. Nests not meeting the above criteria for “occupied” were classified as “unoccupied.” Nest identification numbers are consistent with those provided in the original shapefile.

RESULTS

Nest 19 was observed for four hours on May 9, 2018, and the nest was confirmed to be active. An adult bald eagle attended and fed at least one chick in the nest. Nest 1 was observed for four hours on May 10, 2018, and the nest was confirmed to be unoccupied with no signs of activity. No new branches had been added to the nest, and there were no signs of recent maintenance of the nest (Figure 1).

On May 4 and May 6, 2018, a WEST field technician also attempted to locate and identify the species using two smaller, inactive non-eagle raptor nests that had been identified in the Project during aerial surveys (nests 6 and 18; Figure 1). No raptor nest was located at 18 and because the nest location is within a readily visible tree line and highly detectable if present, the nest was confirmed gone (i.e., likely fell down from tree). Nest 6 is located on private land, and it was not visible from any public road; therefore, the status of this nest could not be confirmed.

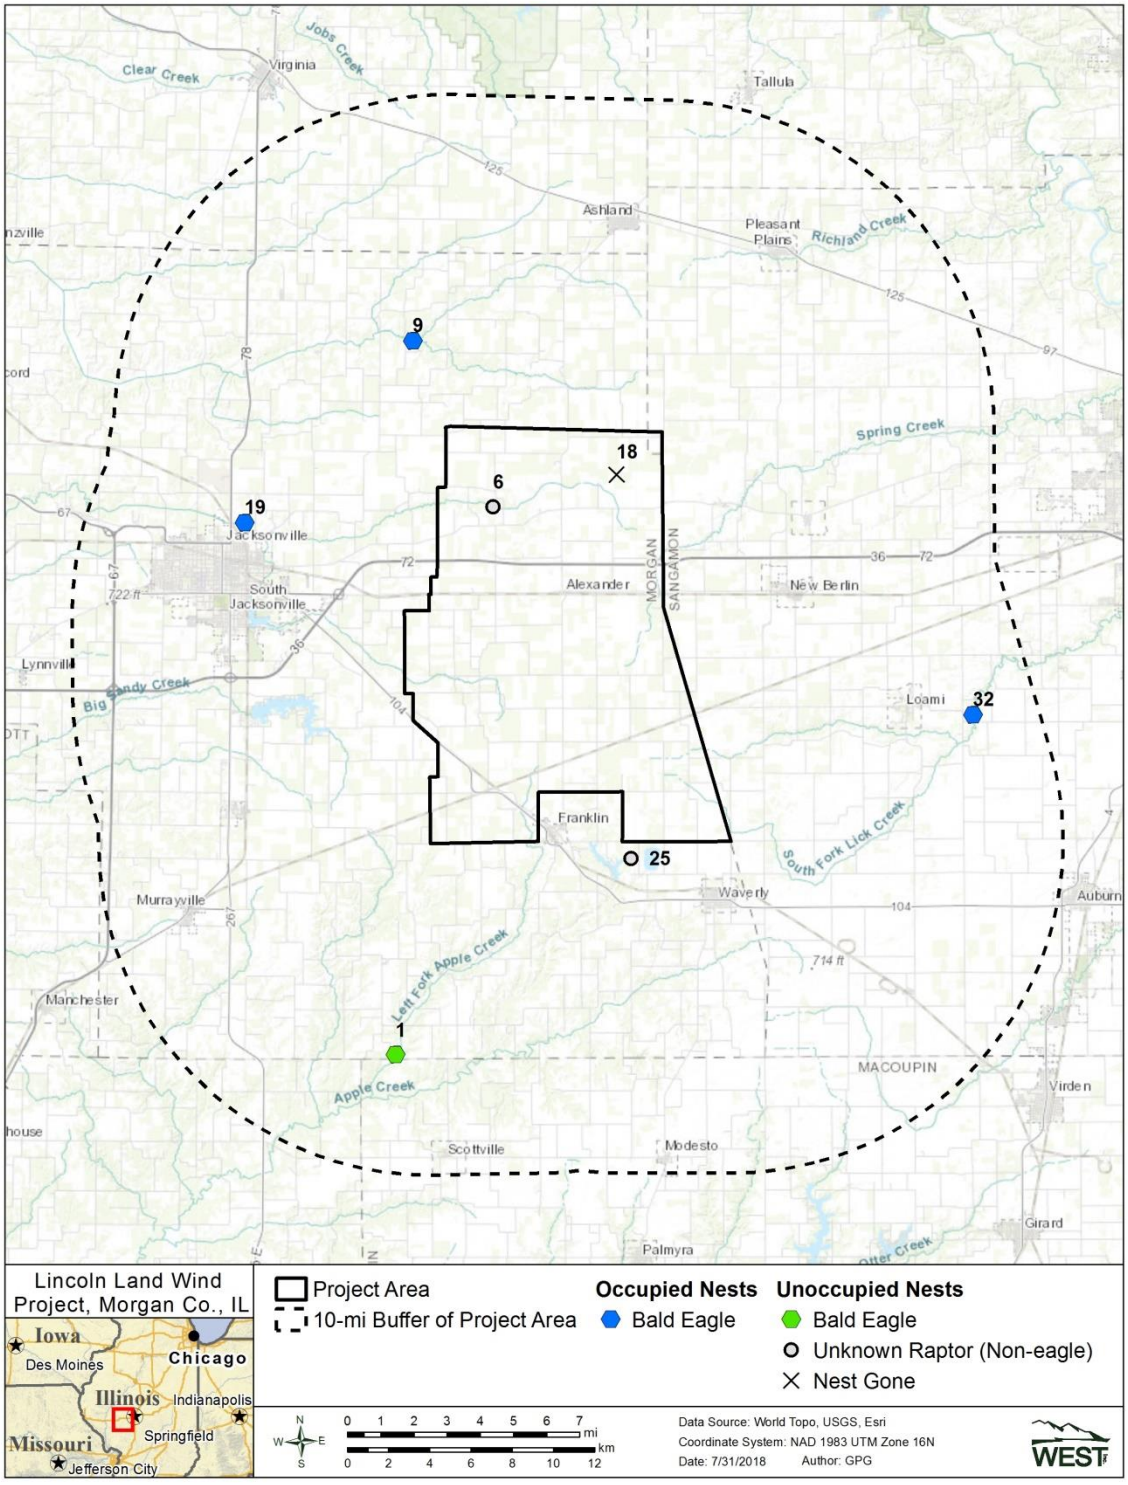

Figure 1. Locations of eagle and other raptor nests documented during aerial and ground surveys at the Lincoln Land Wind Project in Morgan County, Illinois.

EXECUTIVE SUMMARY

Western EcoSystems Technology, Inc. completed mist-nest surveys in accordance with the U.S. Fish and Wildlife Service (USFWS) 2018 *Range-Wide Indiana Bat Survey Guidelines* (USFWS 2018) within the Lincoln Land Wind Project (Project) in Morgan County, Illinois. The main objectives of the surveys were to determine if Indiana bats (INBA) or northern long-eared bats (NLEB) were present within the Project during the summer and to characterize species composition during summer.

Surveys were completed at five mist-net sites from July 29 to August 6, 2018 following USFWS Guidelines (USFWS 2018). At the request of the Illinois Department of Natural Resources, full spectrum bat detectors were also deployed at mist net sites on nights when mist-netting occurred to collect supplementary information on bat species composition within the Project area. No INBA or NLEBs were captured during mist net surveys; however, probable calls of INBA were recorded at one site in the southwestern corner of the Project.

INTRODUCTION

Western EcoSystems Technology, Inc. (WEST) completed mist-nest surveys in accordance with the U.S. Fish and Wildlife Service (USFWS) 2018 *Range-Wide Indiana Bat Survey Guidelines* (USFWS 2018) within the Lincoln Land Wind Project (Project) in Morgan County, Illinois (Figure 1). The main objectives of the surveys were to determine if Indiana bats (*Myotis sodalis*; INBA) or northern long-eared bats (*Myotis septentrionalis*; NLEB) were present within the Project during the summer and to characterize species composition during summer.

Of the nine bat species with the potential to occur in Morgan County, Illinois, two are federally listed under the Endangered Species Act of 1973 (ESA). The INBA is listed as endangered (USFWS 1967) and the NLEB is listed as threatened (USFWS 2015). The gray bat (*M. grisescens;* GRBA) has not been recorded in Morgan County, but due to its occurrence in Pike County, which is adjacent to the Project (Feldhamer et al. 2015) and its federal status (endangered; USFWS 1967), this species was considered in acoustic analyses. No state-listed bat species, other than those that are also federally listed, are known to occur within Morgan County.

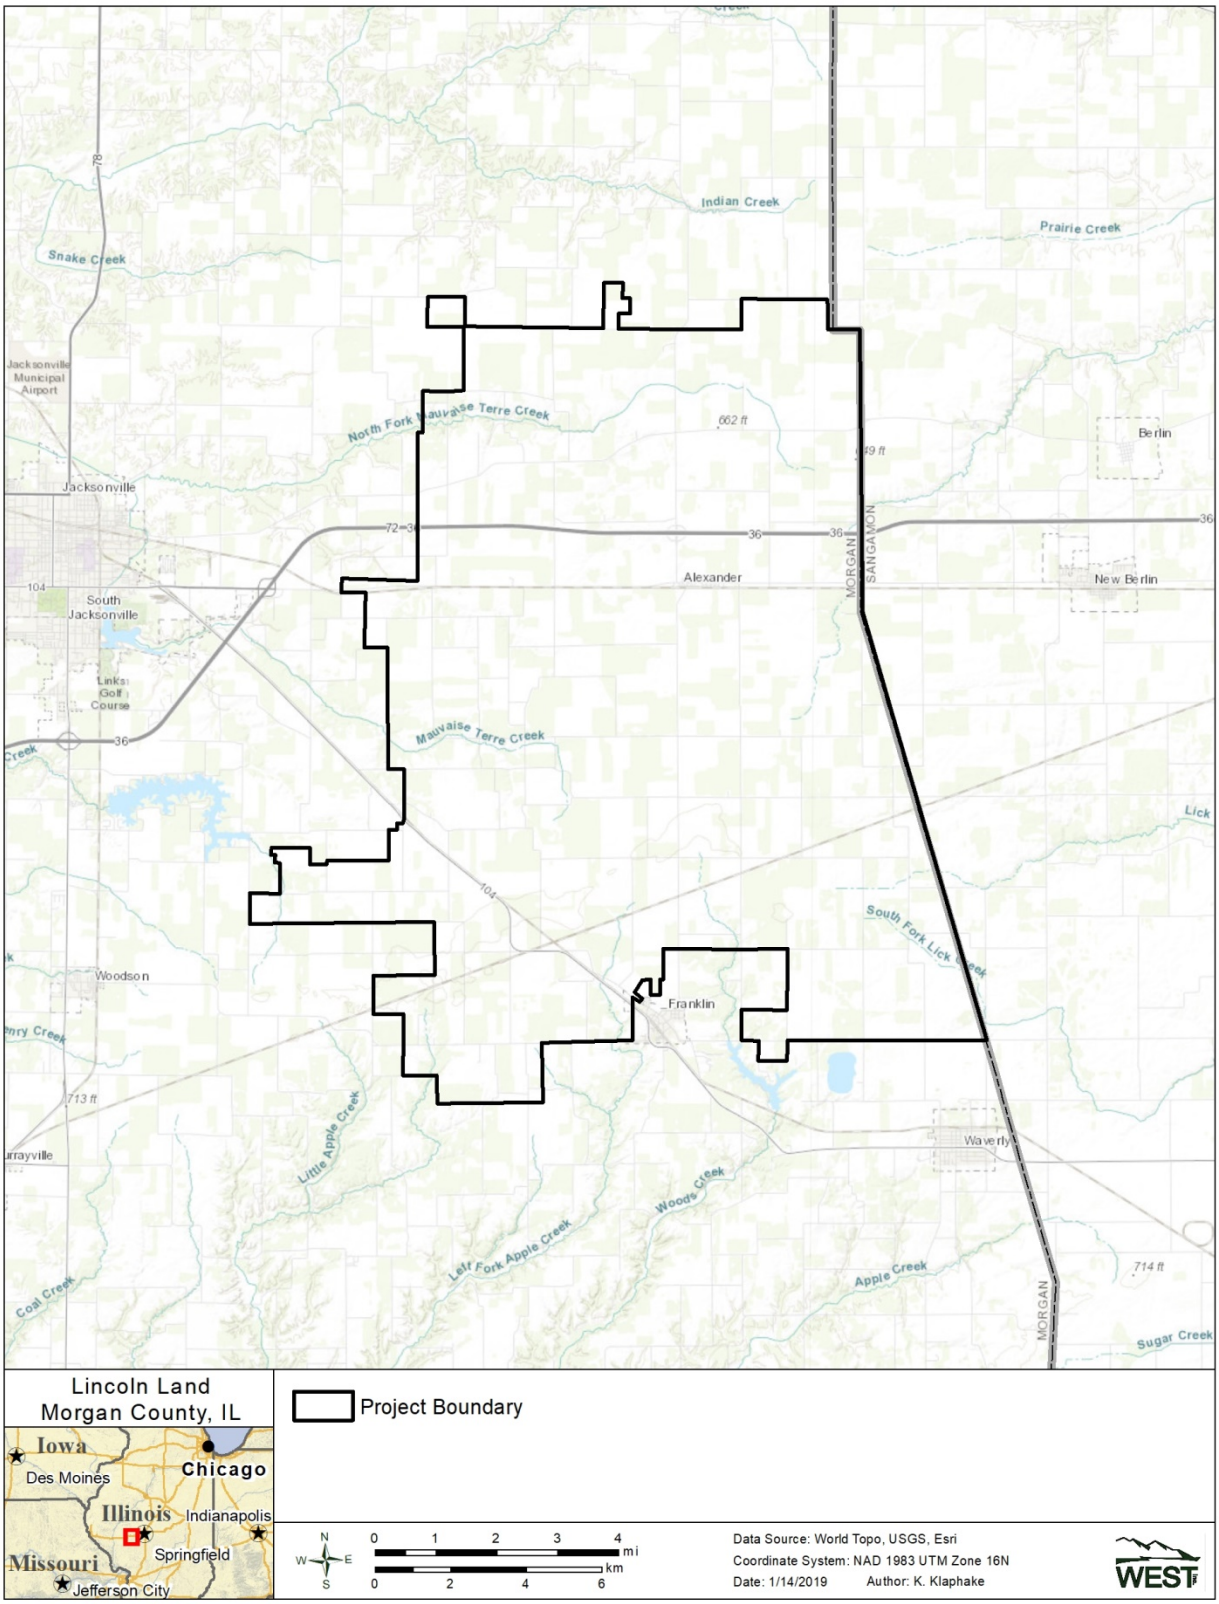

Figure 1. Location of the proposed Lincoln Land Wind Project.

METHODS

Mist-Net Surveys

Mist-nest surveys were implemented in accordance with the 2018 *Range-Wide Indiana Bat Summer Survey Guidelines* (USFWS 2018, which also apply to NLEB). Study plans for the project area initially under consideration were approved by USFWS and Illinois Department of Natural Resources (IDNR) on July 25, 2018 and July 23, 2018, respectively. The Project boundary was expanded at the end of July 2018 and a study plan amendment was approved for the current boundary by both USFWS and IDNR on August 8, 2018 (Figure 2).

The level of effort for mist-net surveys required by USFWS protocol is one site (consisting of nine net-nights) for every 123 acres of suitable habitat within a non-linear project area. Based on a desktop habitat assessment of the acreage of potential suitable habitat for INBA or NLEB within the Project, WEST biologists determined that five survey sites were required within the initial Project boundary to meet the Phase 2 requirements of the USFWS protocol and seven were required in the current Project boundary. Due to access constraints, only five mist net sites were sampled, as opposed to the seven required by the USFWS protocol based on the amount of suitable habitat in the current Project boundary (see Figure 2). Thus, the sampling is representative of the current Project boundary, but is less than the recommended level of effort in the USFWS Guidelines.

Mist-net surveys were completed July 29 through August 6, 2018. Standard 2-ply, 75-denier, nylon mist-nets with a mesh size of 38.00 millimeters (1.30 inches) were used at each mist-net site. Three to five mist-net sets were used at each site, depending on the availability of suitable mist-netting corridors. A mist-net set consisted of two to three mist-nets stacked together and suspended from two poles. Surveys began at sunset and continued for at least five hours, with nets checked every 10 minutes. Net locations were established at least 30 meters (98 feet) apart within each mist-net site whenever possible. All mist-net sites were surveyed for nine net nights for a total of 45 net nights. If weather conditions such as persistent rain (more than 30 minutes), strong winds (more than 14.5 kilometers per hour [9.0 miles per hour] for more than 30 minutes), or cold temperatures (below 10 degrees [°] Celcius [50 °Fahrenheit] for more than 30 minutes) occurred during the netting period, then those net nights were re-surveyed. If a site had nets open more than three nights due to a weather delay (e.g., rain for > 30 minutes, continuous strong winds), then nets were moved on Night 4 within the site per USFWS Guidance. Disturbance in the form of noise and movement were minimized at all net locations. Mist-net sites were selected prior to the study during the desktop analysis by a permitted bat biologist in habitat classified as suitable bat habitat. Specific mist-net sites were determined on-site by permitted bat biologists with INBA and NLEB research experience. All mist-net surveys were performed by staff permitted and approved by USFWS (Permit # TE03495B-2 and TE21829b-2), and Illinois Department of Natural Resources (Scientific Collection Permit #NH18.5496 and Endangered and Threatened Species Permit# 1221) to capture and handle INBA and NLEB. Maps, pictures, and details of mist-net sites are included in appendices A, B, and D.

For each mist-net night, the date, start and end time, site description, site coordinates, mist-net specifics, and weather data (temperature, cloud cover, wind speed, precipitation, and moon phase) were recorded. All captured bats were identified to species. In addition, sex, age, reproductive condition, body mass (grams), forearm length (millimeters), and capture status (recapture/new) were recorded. To assess exposure to White-Nose Syndrome (WNS), a Reichard Index score (0-3) was recorded for all captured bats. To prevent cross contamination of captured bats with *Pseudogymnoascus destructans*, the fungus that causes WNS, the USFWS WNS decontamination protocols were followed for all mist-netting efforts (USWS 2016). Captured bats were measured and processed immediately and were usually released within 15 minutes. Species of bats captured were photo-documented at each site. For INBA, NLEB, and little brown bats, voucher photographs of species-specific identifiable features (e.g., head, body, calcar, foot, toe hairs) were taken.

Acoustic Surveys

At the request of IDNR, a Song Meter full spectrum ultrasonic detector (SM4Bat FS; Wildlife Acoustics, Inc., Concord, Massachusetts) was placed at each mist-net site to evaluate bat activity in the same flight corridor. Detectors were left out for the full night during all nights of survey. At site LL4, the acoustic detector was moved slightly within the site for the last night of surveys to be closer to the new net locations. Universal Transverse Mercator coordinates and brief site descriptions for each acoustic site are listed in Appendix D. Maps and photographs of acoustic survey sites are included in Appendices A and E, respectively.

Bat calls were quantitatively identified using Kaleidoscope Pro (KPro, version 4.2.0; Bats of North America classifier version 4.2.0; Wildlife Acoustics). The appropriate state (Illinois) from the Bats of North America classifier (version 4.2.0) was used and the “Most Sensitive” (i.e., most liberal) setting was selected. All call files identified as INBA, NLEB, or GRBA by KPro were evaluated via qualitative call analysis by a biologist experienced with acoustic identification and who met required USFWS qualifications (Kevin Murray; see USFWS 2018). Qualitative review was also completed for all files from nights that exceeded the maximum likelihood threshold (p-value < 0.05) for INBA or NLEB. If call sequences were not characteristic of INBA, NLEB, or GRBA; contained distinct calls produced by species other than INBA, NLEB, or GRBA; or were of insufficient quality after qualitative review, the calls were reclassified as another species or as unknown. INBA, NLEB and GRBA were considered likely absent from sites where KPro did not identify calls from these species, and from sites where calls where qualitatively reviewed and identified calls to be from other species.

MAP REMOVED – POTENTIAL SENSITIVE SPECIES LOCATIONS

Figure 2. Acoustic and mist-net survey locations at the proposed Lincoln Land Wind Project (US Geological Survey National Land Cover Database 2011, Homer et al. 2015).

RESULTS

Mist-Net Surveys

Mist-nest surveys were completed at five sites between July 29 and August 5, 2018. WEST captured a total of 57 bats, including 30 eastern red bats, 20 big brown bats, six evening bats, and one hoary bat (Table 1). No INBA, NLEB, or GRBA were captured during the 2018 mist-net surveys. Photos of captured bat species are included in Appendix C, and capture details for all bats can be found in Appendix D.

Acoustic Surveys

KPro identified 3,037 bat call files and identified 2,139 files (70.4%) to species (Table 2). KPro identified 90 potential GRBA calls, 63 potential INBA calls, and three potential NLEB calls (Table 3). After qualitative analysis, it was determined that there were no GRBA or NLEB call files, and 18 potential INBA call files (Table 4). All of the INBA calls were recorded on August 5 and 6, 2018 at site LL5, located in the southwest corner of the Project, after mist-net surveys had concluded for the night.

ID = identification.

High-frequency bats are bats that produce acoustic calls greater than 30 kilohertz

CONCLUSIONS

Based on USFWS protocol, probable summer absence of INBA, NLEB and GRBA was confirmed at the Project site; however, supplemental acoustic surveys suggest that INBA likely utilize the suitable habitat located to the southwest of the Project. This area also had the highest level of bat activity observed in the study and likely warrants management consideration to ensure regulatory compliance during operation of the Project.

INTRODUCTION

Copperhead Environmental Consulting, Inc. (Copperhead) completed an aerial raptor nest survey for the proposed Lincoln Land Wind Project (Project) in Morgan County, Illinois. The purpose of the survey was to identify bald eagle (eagle) nests in or within 10 miles and other non-eagle raptor (raptors) nests in or within ½ mile of the Project (Figure 1). The survey was completed in accordance with the guidance provided in the U.S. Fish and Wildlife Service (USFWS) Eagle Conservation Plan Guidance (ECPG 2013) and USFWS recommendations.

PROJECT AREA

The predominant land cover/use types within the Project Area include cultivated crops (90.7%) and hay/pasture (2.6%), which offer limited nesting habitat for eagles and raptors. The remaining land cover/use types account for less than 7% of the Project area combined and include open water (0.1%) and forested landscapes (1.3%), which are habitats associated with nesting eagles and raptors (U.S. Geological Survey National Land Cover Database 2011, Homer et al. 2015). The most common cultivated cropland in Illinois in 2017 was corn and soybean (U.S. Department of Agriculture National Agricultural Statistics Service 2017).

METHODS

Copperhead completed an aerial survey on April 8, 2018, from a Cessna 172 aircraft carrying one pilot and one observer, both trained wildlife biologists with experience completing aerial raptor/eagle nest surveys. Aerial surveys focused on locating stick nest structures in suitable eagle and raptor nesting substrate (trees, transmission lines, etc.) within and around the Project (Figure 1). The survey within the Project area and ½-mile buffer documented all potential eagle and raptor nests while surveys out to 10 miles focused only on identifying potential eagle nests. To estimate available eagle nesting habitat, an assessment of land cover was completed within the Project using NLCD layers prior to the survey.

To ensure adequate coverage, the Project area, ½-mile buffer, and 10-mile buffer were flown with 1-mile to 1.5-mile-wide transects. High-quality habitat was surveyed with flight paths as narrow as 0.5 miles for all eagles and raptors. All observed nest locations were recorded using the on-board GPS tracking system. For each nest, the following data was collected whenever possible: species, occupancy, breeding activity, and number of young/eggs.

Per the ECPG, an eagle nest structure was considered occupied when any of the following were observed: (1) an adult eagle in an incubating position, (2) eggs, (3) nestlings or fledglings, (4) occurrence of a pair of adult eagles (or, sometimes subadults, *e.g.*, Steenhof *et al.* [1983]) at or near a nest through at least the time incubation normally occurs, (5) a newly constructed or refurbished stick nest in the area where territorial behavior of a raptor had been observed early in the breeding

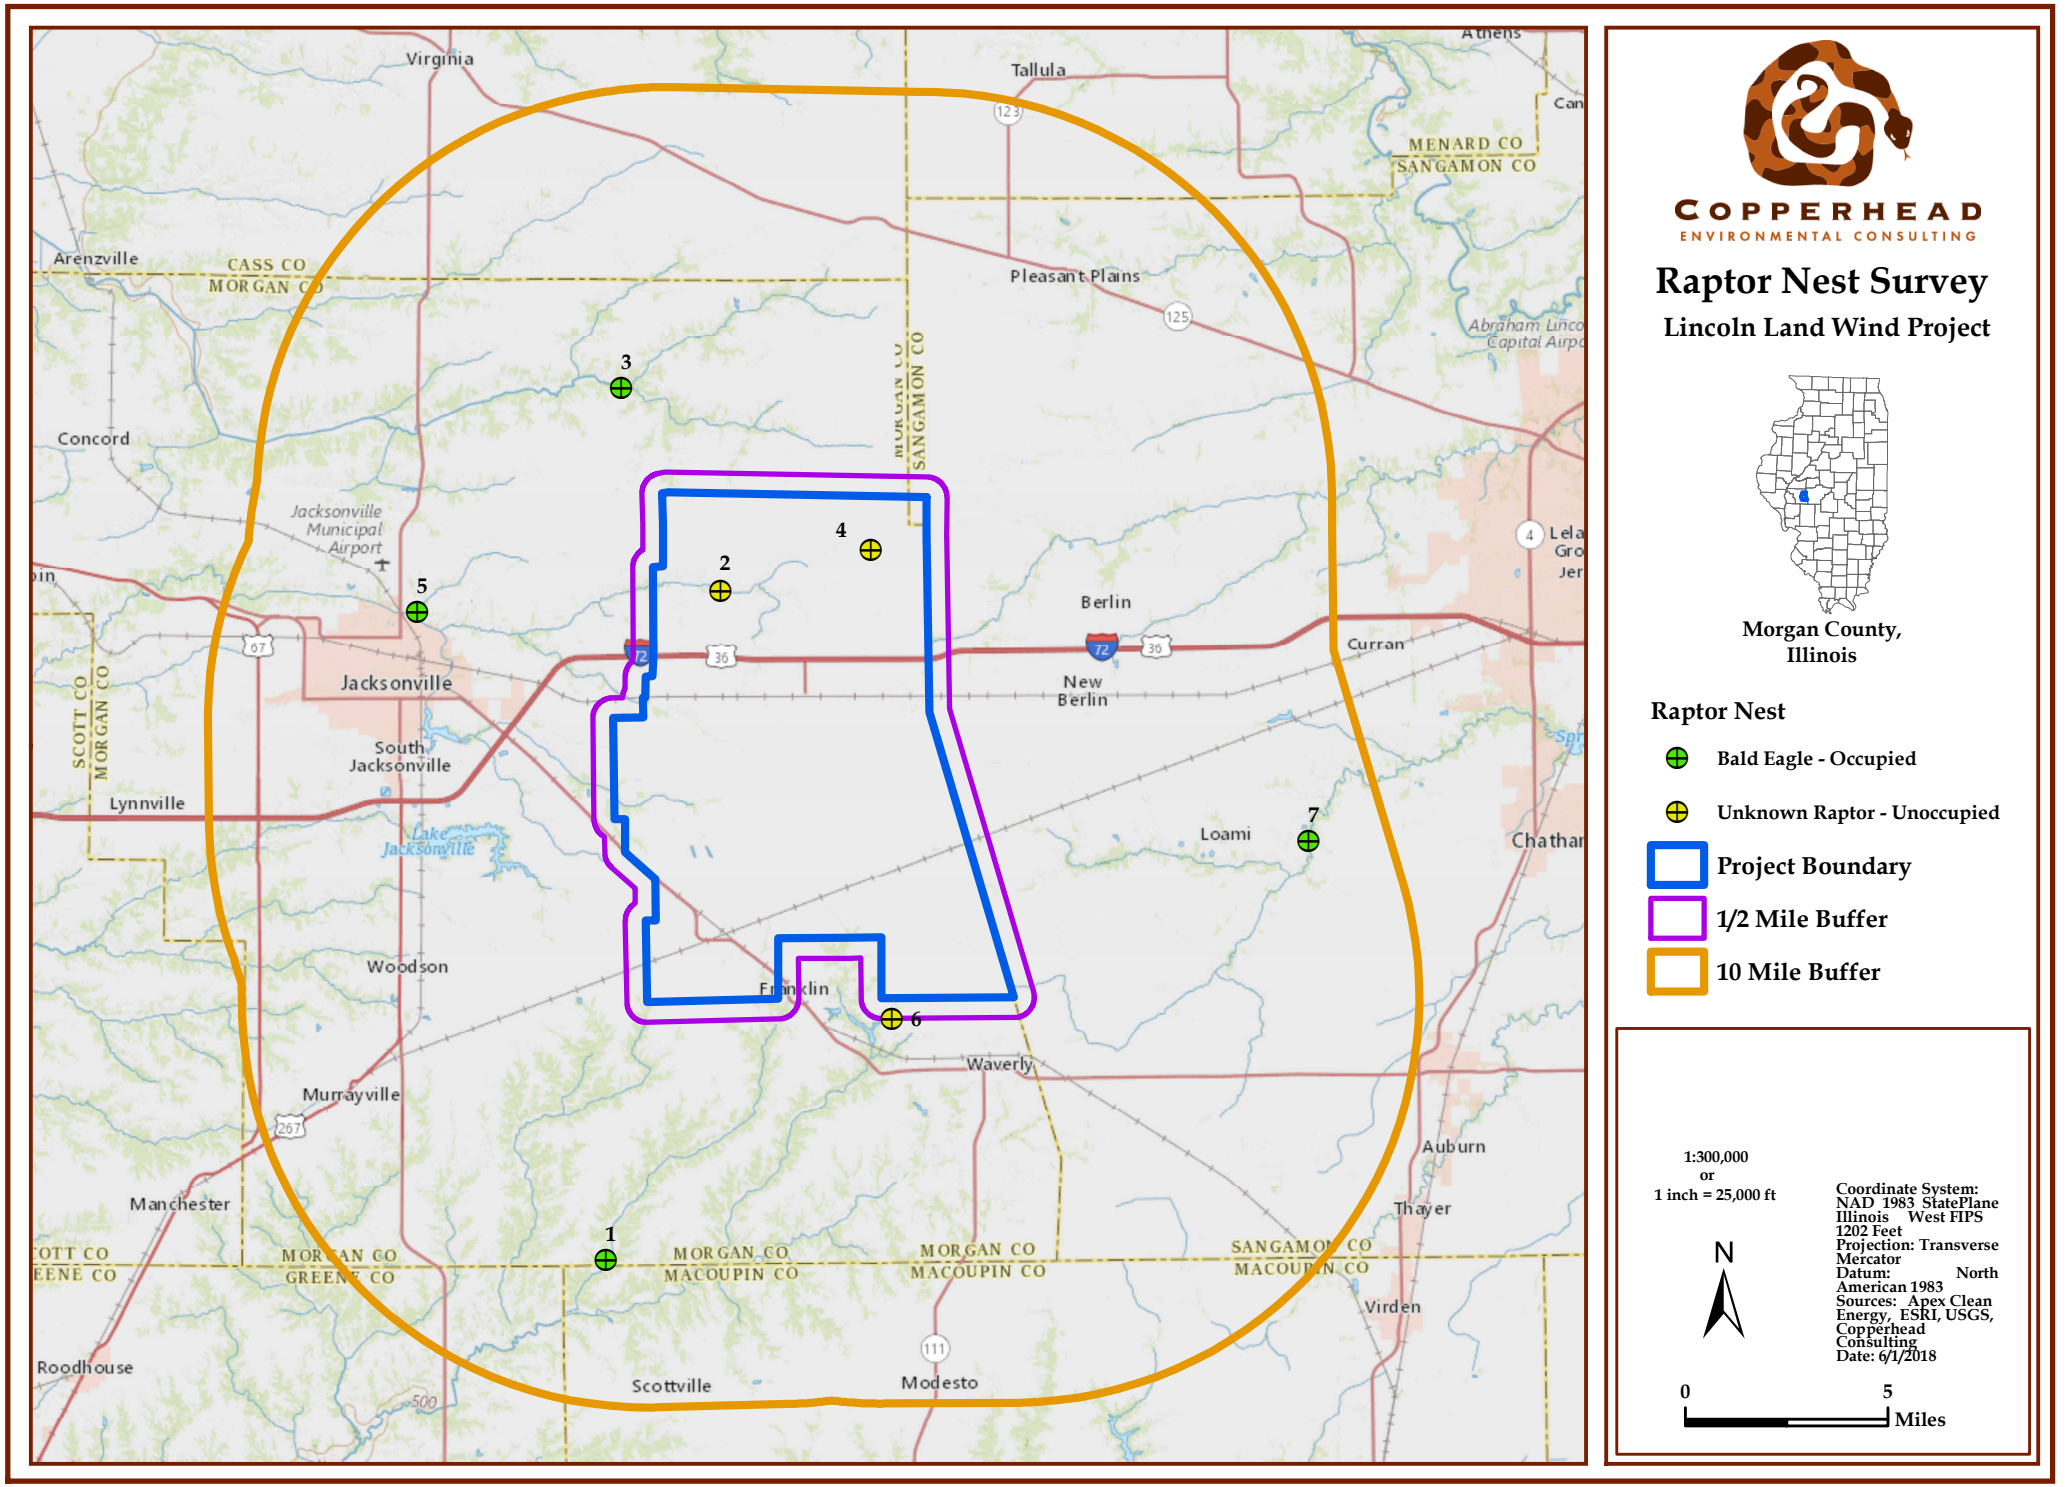

Figure 1. Eagle nest locations within 10 miles and raptor nest locations in and within 1/2 mile of the project area for the proposed Lincoln Land Wind Project, IL

season, or (6) "A recently repaired nest with fresh sticks (clean breaks) or fresh boughs on top, and/or droppings and/or molted feathers on its rim or underneath" (Postupalsky 1974).

For all occupied nests, Copperhead attempted to determine breeding activity by looking for eggs or young within the nest. As raptor nests are smaller and generally lower in the canopy than eagle nests, occupancy can be more difficult to confirm from the air. In these cases, occupancy is confirmed by the visual presence of an incubating adult.

RESULTS

Copperhead identified four eagle nests (Table 1, Figure 1), two which were occupied and active, and two that were occupied, but activity could not be confirmed. No eagle nests were located within the Project area or 1/2-mile buffer, with the nearest occupied eagle nest occurring 2.8 miles to the north of the Project area. Eagle nest photographs are provided in Appendix A.

Three unoccupied inactive non-eagle raptor nests were documented, two within the Project area and one within the ½-mile buffer (Table 1, Figure 1). No breeding adults, eggs, or young were observed in the raptor nests at the time of the survey.

Table 1. Raptor nest locations and occupancy status within 10 miles of the proposed Lincoln Land Wind Project.

Nest ID	Nest Type	Occupancy	Activity	Latitude	Longitude
1	Bald Eagle	Occupied	Unknown	39.522484	-90.134209
2	Unknown Raptor	Unoccupied	None	39.761839	-90.011367
3	Bald Eagle	Occupied	Active	39.834135	-90.127063
4	Unknown Raptor	Unoccupied	None	39.776087	-90.080927
5	Bald Eagle	Occupied	Unknown	39.75428	-90.221509
6	Unknown Raptor	Unoccupied	None	39.608674	-90.002025
7	Bald Eagle	Occupied	Active	39.670838	-89.810893

CONCLUSIONS

The occupied bald eagle nests, all located over 2.8 mi from the Project area, are not likely to be affected by the Project due their distance from the Project. Important eagle use areas or concentration sites as defined by the ECPG are not present in the Project area, which provides less suitable nesting habitat than is available in the surrounding area. The lack of important eagle use areas is supported by the proximity of nests to the Project and the Project mean inter-nest distances having minimal overlap.

INTRODUCTION

Copperhead Environmental Consulting, Inc. (Copperhead) completed an aerial raptor nest survey for the proposed Lincoln Land Wind Project (Project) in Morgan County, Illinois (Figure 1) on March 20 and 21, 2019. This was the second survey of the Project and surrounding area; the first was completed on April 8, 2018. The purpose of these surveys was to document bald eagle (eagle) nests in or within 10 miles of the Project and other non-eagle raptor (raptor) nests in or within 0.5 miles of the Project. The survey was completed in accordance with the U.S. Fish and Wildlife Service (USFWS) Eagle Conservation Plan Guidance (ECPG 2013) and USFWS recommendations.

PROJECT AREA

The predominant land cover/use types within the Project include cultivated crops, developed/open space, and hay/pasture (98% cumulatively), which offer limited nesting habitat for eagles and raptors. The 10-mile buffer area has similar dominant land cover/use, but includes more deciduous forest (mostly located along nearby waterways) than the Project. Land cover/use types suitable for eagle and raptor nesting include open water and forested landscapes which account for approximately 2% of the Project and 11% of the 10-mile buffer area (Table 1; U.S. Geological Survey National Land Cover Database 2011, Homer et al. 2015). The most common cultivated cropland in Illinois in 2017 was corn *(Zea mays)* and soybean (*Glycine max*; U.S. Department of Agriculture National Agricultural Statistics Service 2017).

Table 1. Land use and land cover proportions within the proposed Lincoln Land Wind Project and 10-mile buffer.

Land Use/Land Cover Classification	Project (acres)	10-Mile Buffer* (acres)	Suitable Habitat
Barren Land	0	25	No
Cultivated Crops	57,606	426,152	No
Deciduous Forest	1,076	57,919	Yes
Developed/Open Space	3,511	39,525	No
Emergent Herbaceous Wetlands	0	41	No
Evergreen Forest	8	27	Yes
Hay/Pasture	2,140	32,909	No
Herbaceous	0	265	No
Open Water	35	1,515	Yes
Shrub/Scrub	0	20	No
Woody Wetlands	21	1,268	Yes

* Values within the 10-mile buffer exclude the Project.

Business Confidential – Not for Public Disclosure

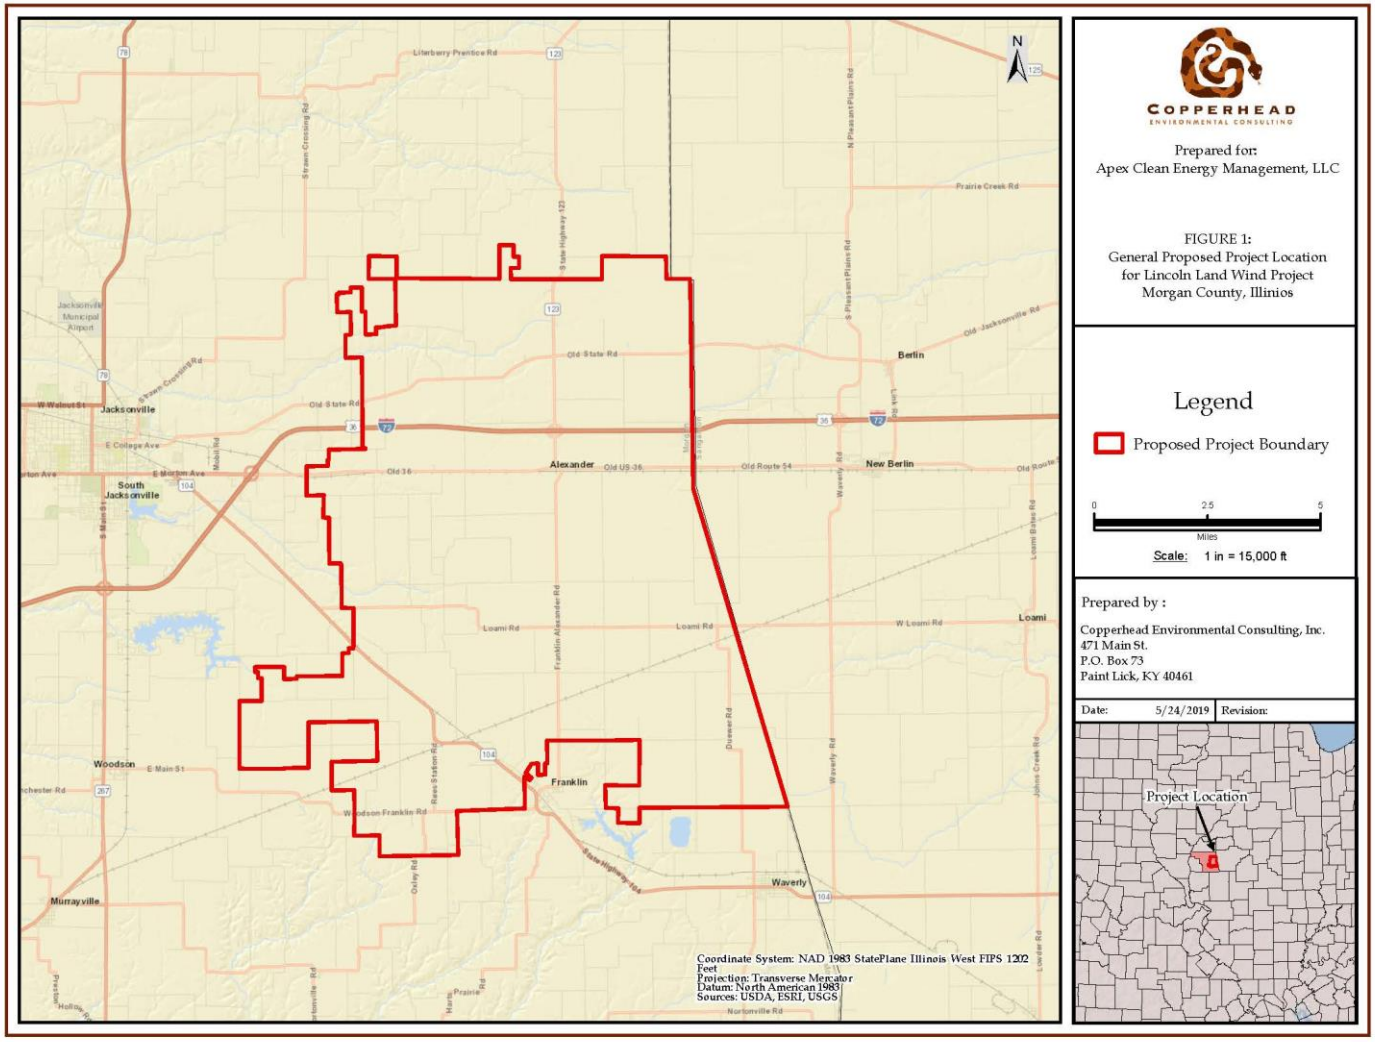

Figure 1. General Proposed Project Location for Lincoln Land Wind Project in Morgan County, Illinois.

METHODS

Copperhead completed the aerial nest survey on March 20 and 21, 2019, as a follow up to a survey completed on April 8, 2018. The survey was completed from a Cessna 172 aircraft carrying one pilot and one observer who is an experienced wildlife biologist. Nest searches within the Project and 0.5-mile buffer documented all eagle and raptor nests, while the survey out to 10 miles focused only on identifying potential eagle nests. The aerial survey focused on locating stick nest structures in suitable eagle and raptor nesting substrate (e.g., trees, transmission lines, etc.) within the Project and buffer areas. To estimate available eagle nesting habitat, an assessment of land cover was completed within the Project using NLCD layers prior to the survey.

To ensure adequate coverage, the Project, 0.5-mile buffer, and 10-mile buffer were flown with 1-mile to 1.5-mile-wide transects. High-quality habitat for all eagles and raptors was surveyed more intensively with flight paths <1 mile apart. All observed nest locations were recorded using mapping software on a laptop computer with built-in GPS. For each nest, the following data were collected whenever possible: species, occupancy, breeding activity, and number of young/eggs.

Per the ECPG, an eagle nest structure was considered occupied when any of the following were observed: (1) an adult eagle in an incubating position, (2) eggs, (3) nestlings or fledglings, (4) occurrence of a pair of adult eagles (or, sometimes subadults, e.g., Steenhof et al. [1983]) at or near a nest through at least the time incubation normally occurs, (5) a newly constructed or refurbished stick nest in the area where territorial behavior of a raptor had been observed early in the breeding season, or (6) "A recently repaired nest with fresh sticks (clean breaks) or fresh boughs on top, and/or droppings and/or molted feathers on its rim or underneath" (Postupalsky 1974). For all occupied nests, Copperhead attempted to determine breeding activity by looking for eggs or young within the nest or adults in an incubation position. As raptor nests are smaller and generally lower in the canopy than eagle nests, occupancy can be more difficult to confirm from the air. In these cases, occupancy was confirmed by the visual presence of an incubating adult.

RESULTS

Eagles

Five occupied and active eagle nests were recorded within the 10-mile buffer area. The eagle nests were widely spaced along waterways. Four of the nests had been identified during the 2018 survey and the fifth nest was new or previously undocumented.

Other Raptors

Three occupied unknown raptor nests were recorded inside the Project and one occupied unknown raptor nest was recorded within the 0.5-mile buffer area. Because their nests are smaller and lower in the canopy, many incubating hawk species look similar and their species cannot

always be confirmed from the air. Alternately, activity may be confirmed by the presence of eggs or nestlings which are also not always clearly identifiable to species from the air.

Three of the four raptor nests were observed during the 2018 surveys; no avian presence was documented at that time and each nest was considered unoccupied.

The locations and occupancy/activity status of each nest are provided in Table 2 and Figure 2 and supported in Appendix A – Eagle Nest Photographs. No photo was collected for nest 6, a raptor nest.

Table 2. Eagle and raptor nest locations and 2019 occupancy status.

Nest ID	Nest Type	Occupancy	Activity	Distance to Project (mi)	Latitude	Longitude	Habitat
1*	Bald Eagle	Occupied	Active	5.48	39.522484	-90.134209	Forest
2*	Unknown Raptor	Occupied	Active	Inside	39.761839	-90.011367	Riparian
3*	Bald Eagle	Occupied	Active	2.88	39.834135	-90.127063	Riparian
4*	Unknown Raptor	Occupied	Active	Inside	39.776087	-90.080927	Windrow
5*	Bald Eagle	Occupied	Active	5.00	39.75428	-90.221509	Riparian
6*	Unknown Raptor	Occupied	Active	0.49	39.608674	-90.002025	Forest
7*	Bald Eagle	Occupied	Active	8.39	39.670838	-89.810893	Forest
8	Bald Eagle	Occupied	Active	2.47	39.693970	-90.185363	Agriculture
9	Unknown Raptor	Occupied	Inactive	Inside	39.763351	-90.104803	Windrow

*Nest was also located during 2018 aerial survey

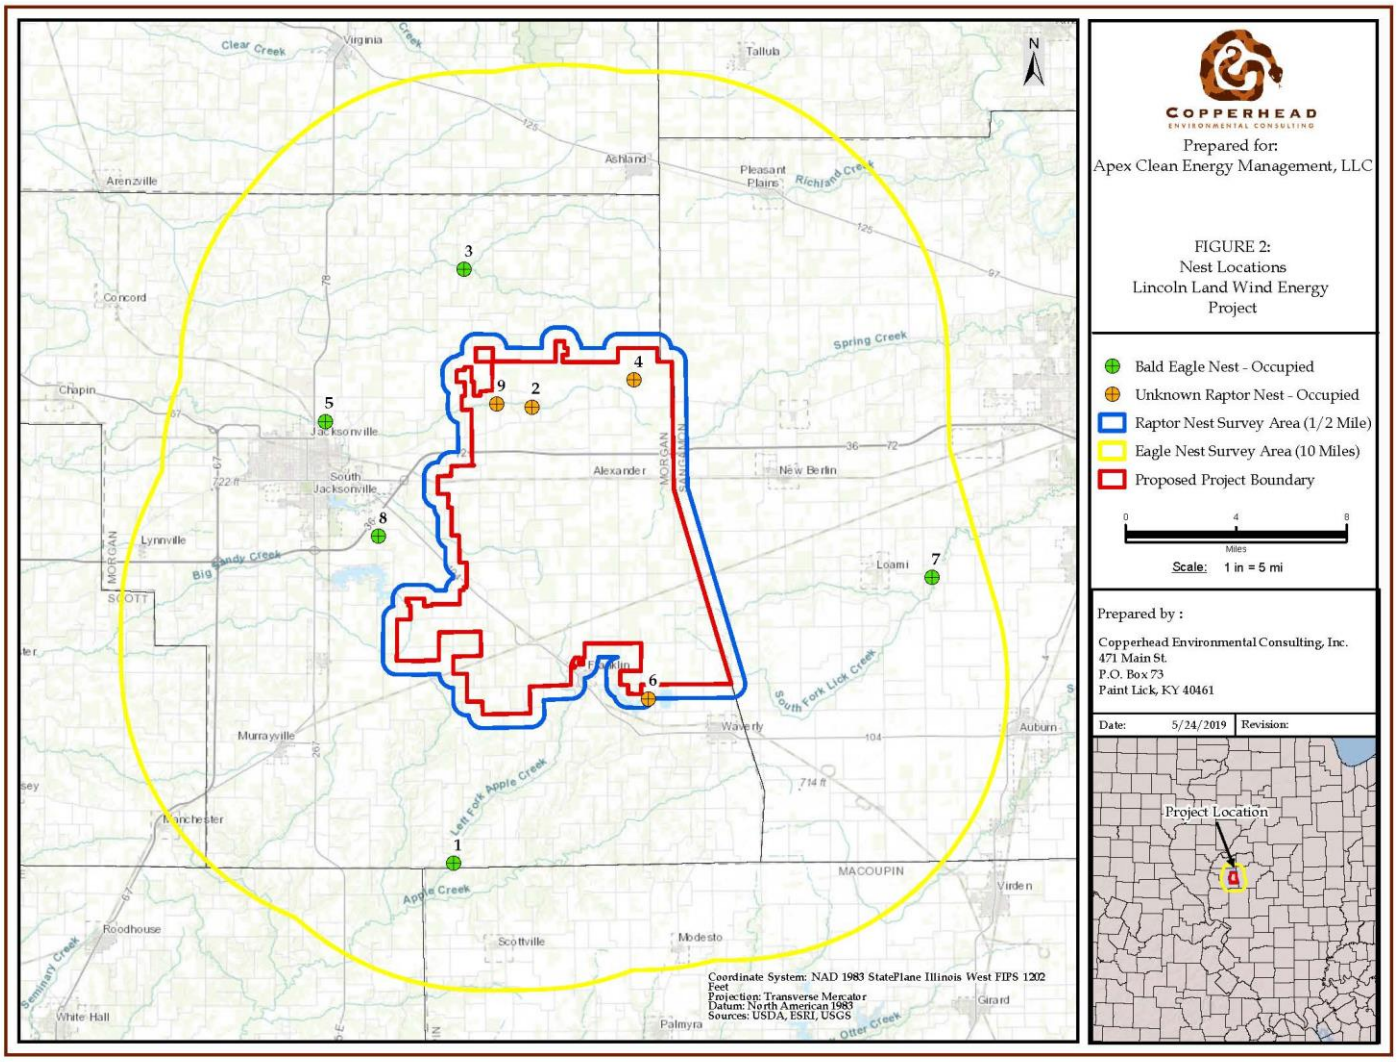

Figure 2. 2019 Nest Locations for the Proposed Lincoln Land Wind Project.

CONCLUSIONS

It is recommended that the three raptor nests within the Project be inspected with a follow-up ground survey should species-specific data be required. The occupied, active bald eagle nests outside the Project are all located over 2 miles from the Project and are not likely to be affected by construction of the Project.

Appendix 11 – AIMA

AGRICULTURAL IMPACT MITIGATION AGREEMENT
between
Lincoln Land Wind, LLC
and the
ILLINOIS DEPARTMENT OF AGRICULTURE
Pertaining to the Construction of a Commercial Wind Energy Facility
in
Morgan **County, Illinois**

The following standards and policies are required by the Illinois Department of Agriculture (IDOA) to help preserve the integrity of any agricultural land that is impacted by the Construction and Deconstruction of a wind energy facility in accordance with the Renewable Energy Facilities Agricultural Impact Mitigation Act (Act), Public Act 100-0598. They were developed with the cooperation of agricultural agencies, organizations, Landowners, Tenants, drainage contractors, and wind energy companies to comprise this Agricultural Impact Mitigation Agreement (AIMA). This AIMA is made and entered into between the Commercial Wind Energy Facility Owner and the IDOA.

Lincoln Land Wind, LLC, an Delaware-based limited liability company authorized to transact business in Illinois, hereafter referred to as "Commercial Wind Energy Facility Owner or Facility Owner", plans to develop an approximately 303.6 MW Commercial Wind Energy Facility or "Facility" in Morgan County, which will consist of approximately 107 turbines, access roads, an underground collection line, a switchyard, a substation, and an operation and maintenance building site.

If construction does not commence within four years after this AIMA has been fully executed, this AIMA will be revised, with the Facility Owner's input, to reflect the IDOA's most current Wind Farm Construction and Deconstruction Standards and Policies. This AIMA, and any updated AIMA, will be filed with the Morgan County Board by the Facility Owner.

This AIMA is applicable to Construction and Deconstruction activities occurring partially or wholly on privately owned agricultural land.

Conditions of the AIMA

The actions set forth in this AIMA shall be implemented in accordance with the conditions listed below:

A. All Construction or Deconstruction activities may be subject to County or other local requirements. However, the specifications outlined in this AIMA shall be the minimum standards applied to all Construction or Deconstruction activities.

B. Except for Section 21(B-F), all actions set forth in this AIMA are subject to modification through negotiation by Landowners and a representative of the Facility Owner, provided such changes are negotiated in advance of any respective Construction or Deconstruction activities.

C. The Facility Owner may negotiate with Landowners to carry out the mitigative actions that Landowners wish to perform themselves. In such instances, the Facility Owner will offer Landowners the area commercial rate for their machinery and labor costs.

D. All mitigative actions will extend to associated future Construction, maintenance, repairs, and Deconstruction of the Commercial Wind Energy Facility.

E. The Facility Owner will exercise Best Efforts to determine all Landowners and Tenants affected by the Construction and Deconstruction of a Facility. The Facility Owner shall keep the Landowners and Tenants informed of the project's status, meetings, and other factors that may have an impact upon their farming operations.

F. The Facility Owner agrees to include a statement of its adherence to this AIMA in any environmental assessment and/or environmental impact statement that may be prepared in connection with the Project.

G. Execution of this AIMA shall be made a condition of any Conditional/Special Use Permit. A copy of this AIMA shall be mailed to each Landowner. Within 30 days of execution of this AIMA, the Facility Owner shall provide postage and mailing labels to the IDOA for mailing to all Landowners. If the Facility Owner becomes aware that a Landowner was not included on the list of Landowners to which a copy of this AIMA was mailed, the Facility Owner shall notify the Department and provide postage and a mailing label as soon as possible.

In the case of a new Underlying Agreement with a Landowner, the Facility Owner shall incorporate this AIMA into such Underlying Agreement.

H. The Facility Owner will implement all mitigative actions to the extent that they do not conflict with the requirements of any applicable federal, state and local rules and regulations and other permits and approvals that are obtained by the Facility Owner for the Project.

I. If any mitigative action(s) is held to be unenforceable, no other provision shall be affected by that holding, and the remainder of the mitigative actions shall be interpreted as if they did not contain the unenforceable provision.

J. No later than 45 days prior to the Construction and/or Deconstruction of a Commercial Wind Energy Facility, the Facility Owner will provide the Landowner(s) with a toll-free number the Landowner can call to alert the Facility Owner should the Landowner(s) have questions or concerns with the work which is being done or has been carried out on his/her property.

K. If the Facility is sold or transferred, the Facility Owner assuming ownership of the facility shall provide notice of such sale or transfer within ninety (90) days to the County and to Landowners, and the existing Financial Assurance requirements, plus the other terms of this AIMA, shall apply to the new Facility Owner.

L. After construction, the Facility Owner will provide the IDOA with "as built" drawings (strip maps) showing the location of all tiles lines damaged in the construction of the Wind Farm. The drawings and GPS tile lines repair coordinates will be provided on a county-by-county basis for distribution by the IDOA to the respective local Soil and Water Conservation District (SWCD) for the purpose of assisting Landowners with future drainage needs.

M. In addition, after all construction is complete, all affected Landowners will receive a copy of the tile repairs location map with GPS coordinates identified as the electric cable crosses their property.

N. The Facility Owner shall comply with all local, state and federal laws and regulations, specifically including the worker protection standards to protect workers from pesticide exposure.

Definitions

Abandonment -	Occurs when Deconstruction has not been completed within 18 months after the wind energy facility reaches the end of its Useful Life.
Aboveground Cable -	Electrical power lines installed above grade to be utilized for conveyance of power from the Wind Turbine(s) to the Wind Facility substation.
Agricultural Impact Mitigation Agreement (AIMA) -	The Agreement between the Commercial Wind Energy Facility Owner and the Illinois Department of Agriculture described herein.
Agricultural Land -	Land used for Cropland, hayland, pasture land, managed woodlands, truck gardens, farmsteads, commercial ag-related facilities, feedlots, livestock confinement systems, land on which farm buildings are located, and land in government set-aside programs used for purposes as set forth above.
Best Efforts -	Diligent, good faith, and commercially reasonable efforts to achieve a given objective or obligation.
Commercial Operation Date -	The calendar date on which the Commercial Wind Energy Facility produces power for commercial sale, not including test power. Within ten (10) calendar days of the Commercial Operation Date, the Commercial Wind Energy Facility Owner shall notify the County and the Department of the Commercial Operation Date in writing.
Commercial Wind Energy Facility (Facility) -	A wind energy conversion facility of equal or greater than 500 kilowatts in total nameplate generating capacity. "Commercial Wind Energy Facility" includes a wind energy conversion facility seeking an extension of a permit to construct granted by a county or municipality before the effective date of this Act. "Commercial Wind Energy Facility" does not include a wind energy conversion facility: (1) that has submitted a complete permit application to a county or municipality and for which the hearing on the completed application has commenced on the date provided in the public hearing notice, which must be before the effective date of this Act; (2) for which a permit to construct has been issued before the effective date of this Act; or (3) that was constructed before the effective date of this Act.
Commercial Wind Energy Facility Owner (Facility Owner) -	A commercial enterprise that owns or operates a Wind Energy Facility of equal to or greater than 500 kilowatts in total nameplate capacity.
County -	The County where the Commercial Wind Energy Facility is located.

Construction - The installation, preparation for installation and/or repair of a Commercial Wind Energy Facility.

Cropland - Land used for growing row crops, small grains, or hay; includes land which was formerly used as cropland, but is currently in a government set-aside program and pastureland comprised of Prime Farmland.

Deconstruction - The removal of a Commercial Wind Energy Facility from the property of a Landowner and the restoration of that property as provided in the Agricultural Impact Mitigation Agreement. The terms "Deconstruction" and "Decommissioning" have the same meaning and, therefore, may be interchanged with each other.

Deconstruction Plan - A plan prepared by a Professional Engineer, at the Commercial Wind Energy Facility Owner expense, that includes:

(1) the estimated Deconstruction cost per turbine, in current dollars at the time of filing, for the Commercial Wind Energy Facility, taking into account, among other things:

- i the number of Wind Turbines and related Commercial Wind Energy Facilities involved,
- ii the original Construction costs of the Commercial Wind Energy Facilities,
- iii the size and capacity of the Wind Turbines,
- iv the salvage value of the Commercial Wind Energy Facilities,
- v the Construction method and techniques for the Wind Turbines and other Commercial Wind Energy Facilities, and

(2) a comprehensive detailed description of how the Commercial Wind Energy Facility Owner plans to pay for the Deconstruction of the Commercial Wind Energy Facility.

Department - The Illinois Department of Agriculture (IDOA).

Financial Assurance - A reclamation bond or other commercially available financial assurance that is acceptable to the County, with the County as primary beneficiary and the Landowners as secondary beneficiaries.

Landowner - Any person with an ownership interest in property that is used for agricultural purposes and that is party to an Underlying Agreement.

Prime Farmland - Agricultural Land comprised of soils that are defined by the USDA Natural Resources Conservation Service (NRCS) as being "prime" soils (generally considered the most productive soils with the least input of nutrients and management).

Professional Engineer -	An engineer licensed to practice engineering in the State of Illinois, and who is determined to be qualified to perform the work described herein by mutual agreement of the County and the Commercial Wind Energy Facility Owner.
Soil and Water Conservation District - (SWCD)	A local unit of government that provides technical and financial assistance to eligible landowners for the conservation of soil and water resources.
Tenant -	Any person lawfully residing or leasing/renting land that is subject to an Underlying Agreement.
Topsoil -	The uppermost layer of the soil that has the darkest color or the highest content of organic matter; more specifically, it is defined as the "A" horizon.
Underlying Agreement -	The written agreement with a Landowner(s) including, but not limited to, an easement, option, lease, or license under the terms of which another person has constructed, constructs, or intends to construct a Commercial Wind Energy Facility on the property of the Landowner.
Underground Cable -	Electrical power lines installed below grade to be utilized for conveyance of power from the Wind Turbine(s) to the Wind Facility substation.
USDA Natural Resources Conservation Service (NRCS) -	NRCS provides America's farmers with financial and technical assistance to voluntarily put conservation on the ground, not only helping the environment but agricultural operations too.
Useful Life -	A Commercial Wind Energy Facility will be presumed to have no remaining Useful Life if: (1) no electricity is generated for a continuous period of twelve (12) months and (2) the Commercial Wind Energy Facility Owner fails, for a period of 6 consecutive months, to pay the Landowner amounts owed in accordance with the Underlying Agreement.
Wind Turbine -	A wind energy conversion unit equal to or greater than 500 kilowatts in total nameplate generating capacity.

Construction and Deconstruction Requirements

1. Support Structures

A. On Agricultural Land, only single pole support structures will be used for overland transmission not located adjacent to the Commercial Wind Energy Facility substation.

B. Where the electric line is adjacent and parallel to highway and/or railroad right-of-way, but on privately owned property, the support structures will be placed as close as reasonably practicable and allowable by the applicable County Engineer or other applicable authorities to the highway or railroad right-of-way. The only exceptions may be at jogs or weaves on the highway alignment or along highways or railroads where transmission and distribution lines are already present.

C. The highest priority will be given to locating the electric line parallel and adjacent to highway and/or railroad right-of-way. When this is not possible, Best Efforts will be expended to place all support poles in such a manner so as to minimize their placement on Cropland (i.e., longer than normal spans will be utilized when traversing Cropland).

2. Aboveground Facilities

Locations for Facilities shall be selected in a manner so as to be as unobtrusive as reasonably possible to ongoing agricultural activities occurring on the land that contains the facilities. The Facility Owner's compliance with applicable local, county, state, and federal statutes, rules, regulations, and ordinances, and its securing any variations or waivers to such statutes, rules, regulations, and ordinances in accordance with applicable law, in selecting such locations shall constitute compliance with this provision.

3. Guy Wires and Anchors

A. Best Efforts will be made to place guy wires and their anchors out of cropland, pastureland and hayland, placing them instead along existing utilization lines and on land not used for row crops, pasture or hay. Where this is not feasible, Best Efforts will be made to minimize guy wire impact on Cropland.

B. All guy wires will be shielded with highly visible guards.

4. Underground Cabling Depth

A. Underground electrical cables will be buried with:

1. a minimum of 5 feet of top cover where it crosses Cropland.
2. a minimum of 5 feet of top cover where it crosses pasture land or other Agricultural Land comprised of soils that are classified by the USDA as being prime soils.
3. a minimum of 3 feet of top cover where it crosses pasture land and other Agricultural Land not comprised of prime soils.
4. a minimum of 3 feet of top cover where it crosses wooded/brushy land.

B. Notwithstanding the foregoing, in those areas where (i) rock in its natural formation and/or (ii) a continuous strata of gravel exceeding 200 feet in length are encountered, the minimum top cover will be 30 inches.

5. Topsoil Removal and Replacement

A. Any excavation shall be performed in a manner to preserve topsoil. Best Efforts will be made to store the topsoil near the excavation site in such a manner that it will not become intermixed with subsoil materials.

B. Best Efforts will be made to store all disturbed subsoil material near the excavation site and separate from the topsoil.

C. When backfilling an excavation site, the stockpiled subsoil material will be placed back into the excavation site before replacing the topsoil.

D. Refer to Item No. 7.A. through 7.D for procedures pertaining to rock removal from the subsoil and topsoil.

E. Refer to Items No. 8.A. through 8.D. for procedures pertaining to the alleviation of compaction of the topsoil.

F. Best Efforts will be performed to place the topsoil in a manner so that after settling occurs, the topsoil's original depth and contour (with an allowance for settling) will be restored as close as reasonably practicable. The same shall apply where excavations are made for road, stream, drainage ditch, or other crossings. In no instance will the topsoil materials be used for any other purpose unless agreed to otherwise by the Landowner.

G. Excess subsoil material resulting from wind turbine foundation excavation shall be removed from Landowner's property, unless otherwise agreed to by Landowner.

H. Topsoil stripping or separation is not required for the excavation of narrow trenches, those 24 inches wide or less.

6. Repair of Damaged Tile Lines

If underground drainage tile is damaged by Construction or Deconstruction, it will be repaired in a manner that assures the tile line's proper operation at the point of repair. The following shall apply to the tile line repair:

A. The Facility Owner will work with the Landowner to identify the tile lines traversing the property included within the Underlying Agreement which will be crossed or disturbed by the construction of the Facility. All tile lines identified in this manner will be shown on the Construction and Deconstruction Plans and staked or flagged in the locations where expected crossing or disturbance is anticipated prior to Construction or Deconstruction to alert Construction and Deconstruction crews to the possible need for tile line repairs.

B. Tile lines that are damaged, cut, or removed shall be staked or flagged with stakes or flags placed in such a manner they will remain visible until the permanent repairs are completed. In addition, the location of damaged drain tile lines will be recorded using Global Positioning Systems (GPS) technology.

C. If water is flowing through any damaged tile line, the Facility Owner shall utilize Best Efforts to immediately and temporarily repair the tile line until such time that the Facility Owner can make permanent repairs. If the tile lines are dry and water is not flowing, temporary repairs are not required if the permanent repairs can be made by the Facility Owner within 14 days (weather and soil conditions permitting) of the time damage occurred; however, the exposed tile lines will be screened or otherwise protected to prevent the entry of foreign materials or animals into the tile lines.

D. Where tile lines are severed by an excavation trench, repairs shall be made using the IDOA Drain Tile Repairs, Figures 1 and 2.

If there is any dispute between the Landowner and the Facility Owner on the method of permanent tile line repair, the appropriate Soil and Water Conservation District's opinion shall be considered by the Facility Owner and the Landowner.

E. To the extent practicable, there will be a minimum of one foot of separation between the tile line and the Underground Cable whether the Underground Cable passes over or under the tile line. If the tile line was damaged as part of the excavation for installation of the Underground Cable, the Underground Cable will be installed with a minimum one foot clearance below or over the tile line to be repaired or otherwise to the extent practicable.

F. The original tile line alignment and gradient shall be maintained. A laser transit shall be used to ensure the proper gradient is maintained. A laser operated tiling machine shall be used to install or replace tiling segments of 100 linear feet or more.

G. During Construction stage, all permanent tile line repairs must be made within fourteen (14) days of identification or notification of the damage, weather and soil conditions permitting. At other times, such repairs must be made at a time mutually agreed upon by the Facility Owner and the Landowner.

H. Following Construction and/or Deconstruction activities, the Facility Owner will utilize best practices to restore the drainage in the area to the condition it was before the commencement of the Construction/Deconstruction activities. If the Facility Owner cannot agree upon a reasonable method to complete this restoration, the Facility Owner may – but is not required to – implement the recommendations of the appropriate County SWCD and such implementation would resolve the dispute.

I. Following completion of the work, the Facility Owner will be responsible for correcting or paying for the correction of all tile line repairs that fail due to Construction and/or Deconstruction, provided any such failure was identified by Landowner within twenty-four (24) months after Construction or Deconstruction. The Facility Owner will not be responsible for tile line repairs that the Facility Owner pays the Landowner to perform. Facility Owner shall use Best Efforts to utilize a local drain tile repair company.

7. Rock Removal

The following rock removal procedures only pertain to rocks found in the uppermost 42 inches of soil, the common freeze zone in Illinois, which emerged on Landowner property as a result of Construction and/or Deconstruction.

A. Before replacing any Topsoil, Best Efforts will be taken to remove all rocks greater than 3 inches in any dimension from the surface of exposed subsoil which were brought to the site as a result of Construction and/or Deconstruction.

B. As topsoil is replaced, all rocks greater than 3 inches in any dimension will be removed from the topsoil which emerged at the site as a result of Construction and/or Deconstruction activities.

C. If trenching, blasting, or boring operations are required through rocky terrain, precautions will be taken to minimize the potential for oversized rocks to become interspersed with adjacent soil material.

D. Rocks and soil containing rocks removed from the subsoil areas, topsoil, or from any excavations, will be hauled off the Landowner's premises or disposed of on the Landowner's premises at a location that is mutually acceptable to the Landowner and the Facility Owner.

8. Compaction and Rutting

A. Unless the Landowner opts to do the restoration work, after the topsoil has been replaced, all areas that were traversed by vehicles and Construction and/or Deconstruction equipment will be ripped at least 18 inches deep, and all pasture and woodland will be ripped at least 12 inches deep to the extent practicable. The existence of tile lines or underground utilities may necessitate less depth. The disturbed area will then be disked. Decompaction shall be conducted according to the guidelines provided in Appendices A and B.

B. To the extent practicable, all ripping and disking will be done at a time when the soil is dry enough for normal tillage operations to occur on land adjacent to the right-of-way.

C. The Facility Owner will restore all rutted land to a condition as close as possible to its original condition.

D. If there is any dispute between the Landowner and the Facility Owner as to what areas need to be ripped/disked or the depth at which compacted areas should be ripped/disked, the appropriate County SWCD's opinion shall be considered by the Facility Owner and the Landowner.

9. Construction During Wet Weather

Except as provided below, construction activities are not allowed on farmland where normal farming operations, such as plowing, disking, planting or harvesting, cannot take place due to excessively wet soils. Wet weather conditions are to be determined on a field by field basis and not for the project as a whole.

A. Construction activities on prepared surfaces, surfaces where topsoil and subsoil have been removed, heavily compacted in preparation, or otherwise stabilized (e.g. through cement mixing) may occur at the discretion of the Facility Owner in wet weather conditions.

B. Construction activities on unprepared surfaces will be done only when work will not result in rutting which results in a mixing of subsoil and topsoil. Determination as to the potential of subsoil and topsoil mixing will be in consultation with the underlying Landowner, or, if approved by the Landowner, his/her designated Tenant.

10. Land Leveling

A. Following the completion of Construction and/or Deconstruction of a Commercial Wind Energy Facility, the Facility Owner will utilize Best Efforts to restore the disturbed area to its original pre-construction elevation and contour should uneven settling occur or surface drainage problems develop as a result of said activity.

B. If, within twenty-four (24) months after Construction or Deconstruction, uneven settling occurs or surface drainage problems develop as a result of the Construction or Deconstruction of a Facility, the Facility Owner will provide such land leveling services within 45 days of a Landowner's written notice, weather and soil conditions permitting.

C. If there is any dispute between the Landowner and the Facility Owner as to what areas need additional land leveling beyond that which is done at the time of Construction, the Facility Owner may – but is not required to – implement the recommendations of the appropriate SWCD and such implementation will resolve the dispute.

11. Prevention of Soil Erosion

A. The Facility Owner will work with Landowners to prevent excessive erosion on land that has been disturbed by Construction or Deconstruction of a Commercial Wind Energy Facility. Consultation with the local SWCD by the Facility Owner will take place to determine the appropriate methods to be implemented to control erosion. This is not a requirement, however, if the land is bare Cropland that the Landowner intends to leave bare until the next crop is planted.

B. If the Landowner and Facility Owner cannot agree upon a reasonable method to control erosion on the Landowner's right-of-way, the Facility Owner may – but is not required to – implement the recommendations of the appropriate SWCD and such implementation will resolve the dispute.

12. Repair of Damaged Soil Conservation Practices

Consultation with the local SWCD by the Facility Owner will be carried out to determine if there are soil conservation practices (such as terraces, grassed waterways, etc.) that will be damaged by the Construction and/or Deconstruction of a Commercial Wind Energy Facility. Those conservation practices will be restored to their preconstruction condition as close as reasonably practicable in accordance with USDA Natural Resources Conservation Service technical standards. All repair costs shall be borne by the Facility Owner.

13. Damages to Private Property

The Facility Owner will reasonably compensate Landowners for damages caused by the Facility Owner. Damage to Cropland will be reimbursed to the Landowner as prescribed in the applicable Underlying Agreement.

14. Clearing of Trees and Brush

A. If trees are to be removed for the Construction or Deconstruction of a Commercial Wind Energy Facility, the Facility Owner will consult with the Landowner to determine if there are trees of commercial or other value to the Landowner.

B. If there are trees of commercial or other value to the Landowner, the Facility Owner will allow the Landowner the right to retain ownership of the trees to be removed with the disposition of the removed trees to be negotiated prior to the commencement of land clearing.

C. Unless otherwise restricted by federal, state or local regulations, the Facility Owner will follow the Landowner's desires regarding the removal and disposal of trees, brush, and stumps of no value to the Landowner by burning, burial, etc., or complete removal from any affected property.

15. Interference with Irrigation Systems

A. If the Construction or Deconstruction of a Commercial Wind Energy Facility interrupts an operational (or soon to be operational) spray irrigation system, the Facility Owner will establish with the Landowner an acceptable amount of time the irrigation system may be out of service.

B. If, as a result of Construction or Deconstruction of a Facility, an irrigation system interruption results in crop damages, the Landowner will be compensated for all such crop damages per the applicable Underlying Agreement.

C. If it is feasible and mutually acceptable to the Facility Owner and the Landowner, temporary measures will be implemented to allow an irrigation system to continue to operate across land on which a Facility is also being Constructed or Deconstructed.

16. Access Roads

A. To the extent practicable, access roads will be designed to not impede surface drainage and will be built to minimize soil erosion on or near the access roads.

B. Access roads may be left intact through mutual agreement of the Landowner and the Facility Owner unless otherwise restricted by federal, state, or local regulations after the Useful Life.

C. If the access roads are removed, Best Efforts will be expended to assure that the land shall be restored to equivalent condition(s) as existed prior to their construction, or as otherwise agreed to by the Facility Owner and the Landowner. All access roads that are removed shall be ripped to a depth of 18 inches. All ripping will be done consistent with Items 8.A. through 8.D.

17. Weed Control

A. The Facility Owner will provide for weed control in a manner that prevents the spread of weeds onto agricultural land affected by Construction or Deconstruction. Spraying will be done by a pesticide applicator that is appropriately licensed for doing such work in the State of Illinois.

B. The Facility Owner will be responsible for reimbursing all reasonable costs incurred by owners of agricultural land affected by Construction or Deconstruction where it has been determined that weeds have spread from land impacted by the Facility. Reimbursement is contingent upon written notice to the Facility Owner and failure to respond within forty-five (45) days after notice is received.

18. Pumping of Water from Open Excavations

A. In the event it becomes necessary to pump water from open excavations, the Facility Owner will pump the water in a manner that will avoid damaging agricultural land affected by Construction or Deconstruction. Such damages include, but are not limited to: inundation of crops for more than 24 hours, deposition of sediment in ditches and other water courses, and the deposition of subsoil sediment and gravel in fields and pastures.

B. If it is impossible to avoid water-related damages as described in Item 18.A. above, the Facility Owner will compensate the Landowner for damages to crops as prescribed in the applicable Underlying Agreement.

C. All pumping of water shall comply with existing drainage laws, local ordinances relating to such activities and any other applicable laws, specifically including the Clean Water Act.

19. Advance Notice of Access to Private Property

A. The Facility Owner will provide the Landowner or Tenant with a minimum of 48 hours prior notice before accessing his/her property for the purpose of Construction or Deconstruction of a Commercial Wind Energy Facility.

B. Prior notice shall consist of either: (i) a personal contact, telephone contact or email contact, whereby the Landowner or tenant is informed of the Facility Owner's intent to access the land; or (ii) the Facility Owner mails or hand delivers to the Landowner or tenant's home a dated, written notice of the Facility Owner's intent. Such written or hand delivered notice shall include a toll-free number at which agents of the Facility Owner can be reached. The Landowner or tenant need not acknowledge receipt of the written notice before the Facility Owner can enter the Landowner's property.

20. Indemnification

The Commercial Wind Energy Facility Owner will indemnify all Landowners, their heirs, successors, legal representatives, and assigns from and against all claims, injuries, suits, damages, costs, losses, and reasonable expenses resulting from or arising out of Construction and/or Deconstruction, including damage to such Commercial Wind Energy Facility or any of its appurtenances, except where claims, injuries, suits, damages, costs, losses, and expenses are caused by the negligence or intentional acts, or willful omissions of such Landowners, and/or the Landowners heirs, successors, legal representatives, and assigns. In such circumstances, the Landowners, and the Landowners' heirs, successors, legal representatives, and assigns will indemnify the Facility Owner, its heirs, successors, legal representatives, and assigns from and against said claims, injuries, suits, damages, costs, losses, and reasonable expenses including but not limited to attorneys' fees and costs.

21. Deconstruction of Commercial Wind Energy Facilities and Financial Assurance

A. Deconstruction of a Facility shall include the removal/disposition of the following equipment/facilities utilized for operation of the Facility and located on Landowner property:

1. Wind Turbine towers and blades;

2. Wind Turbine generators;
3. Wind Turbine foundations (to depth of 5 feet);
4. Transformers;
5. Collection/interconnection substation (components, cable, and steel foundations), provided, however, that electrical collection cables at a depth of 5 feet or greater may be left in place;
6. Overhead collection system;
7. Operations/maintenance buildings, spare parts buildings and substation/ switching gear buildings unless otherwise agreed to by the Landowner;
8. Access Road(s) (unless Landowner requests in writing that the access road is to remain);
9. Operation/maintenance yard/staging area unless otherwise agreed to by the Landowner; and
10. Debris and litter generated by Deconstruction and Deconstruction crews.

B. The Facility Owner shall, at its expense, complete Deconstruction of a Commercial Wind Energy Facility within eighteen (18) months after the end of the Useful Life of the Facility.

C. During the County permit process, the Facility Owner shall file with the County, a Deconstruction Plan. A second Deconstruction Plan shall be filed with the County on or before the end of the tenth year of the Commercial Operation Date.

D. The Facility Owner shall provide the County with Financial Assurance to cover the estimated costs of Deconstruction of the Commercial Wind Energy Facility. Provision of this Financial Assurance shall be phased in over the first 11 years of the Project's operation as follows:

1. On or before the first anniversary of the Commercial Operation Date, the Facility Owner shall provide the County with Financial Assurance to cover ten (10) percent of the estimated costs of Deconstruction of the Facility as determined in the Deconstruction Plan provided during the county permit process.

2. On or before the sixth anniversary of the Commercial Operation Date, the Facility Owner shall provide the County with Financial Assurance to cover fifty (50) percent of the estimated costs of Deconstruction of the Facility as determined in the Deconstruction Plan provided during the county permit process.

3. On or before the eleventh anniversary of the Commercial Operation Date, the Facility Owner shall provide the County with Financial Assurance to cover one hundred (100) percent of the estimated costs of Deconstruction of the Facility as determined in the Deconstruction Plan provided during the tenth year of the Commercial Operation Date.

The Financial Assurance shall not release the surety from liability until the Financial Assurance is replaced. The salvage value of the Facility may only be used to reduce the estimated costs of Deconstruction in the Deconstruction Plan if the County agrees that all interests in the salvage value are subordinate or have been subordinated to that of the County if Abandonment occurs.

E. The County may – but is not required to – reevaluate the estimated costs of Deconstruction of any Commercial Wind Energy Facility after the tenth anniversary, and every five years thereafter, of the Commercial Operation Date which reevaluation must be performed by an independent third party Professional Engineer licensed in the State of Illinois. The County shall provide the Facility Owner with a copy of any reevaluation report. Based on any reevaluation, the County may require changes in the level of Financial Assurance used to calculate the phased coverages described in Section 21 D. required from the Facility Owner. The Facility Owner shall be responsible for the cost of any reevaluation by a third party Professional Engineer.

F. Upon Abandonment, the County may take all appropriate actions for Deconstruction, including drawing upon the Financial Assurance. In the event the County declines to take any action for Deconstruction, the Landowners may draw upon the Financial Assurance.

Concurrence of the Parties to this AIMA

The Illinois Department of Agriculture and Lincoln Land Wind, LLC concur that this AIMA is the complete AIMA governing the mitigation of agricultural impacts that may result from the construction of the wind farm project in Morgan County within the State of Illinois.

The effective date of this AIMA commences on the date of execution.

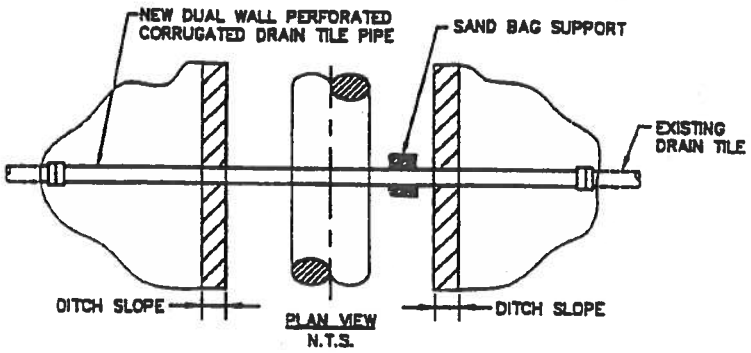
PLAN
N.T.S.

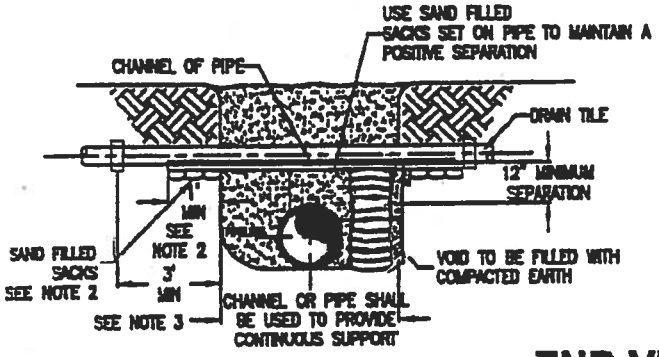
*CHANNEL – OPEN OR SLOTTED CORRUGATED GALVANIZED, PVC OR ALUMINUM CRADLE TO SUPPORT DRAIN TILE.



CROSS SECTION
N.T.S.

NOTE:

1. IMMEDIATELY REPAIR TILE IF WATER IS FLOWING THROUGH TILE AT TIME OF TRENCHING. IF NO WATER IS FLOWING AND TEMPORARY REPAIR IS DELAYED, OR NOT MADE BY THE END OF THE WORK DAY, A SCREEN OR APPROPRIATE 'NIGHT CAP' SHALL BE PLACED ON OPEN ENDS OF TILE TO PREVENT ENTRAPMENT OF ANIMALS ETC.
2. CHANNEL OR PIPE (OPEN OR SLOTTED) MADE OF CORRUGATED GALVANIZED PIPE, PVC OR ALUMINUM WILL BE USED FOR SUPPORT OF DRAIN TILE SPANS.
3. INDUSTRY STANDARDS SHALL BE FOLLOWED TO ENSURE PROPER SEAL OF REPAIRED DRAIN TILES.



TEMPORARY DRAIN TILE REPAIR

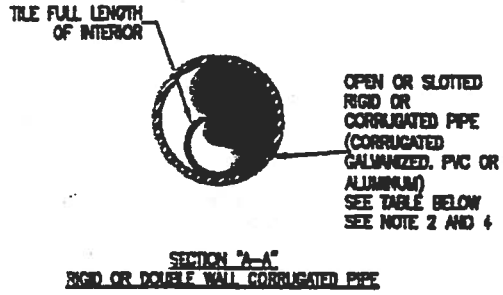


FIGURE 2.

PLAN VIEW
N.T.S.

PLAN VIEW

SECTION "A-A"
RIGID OR DOUBLE WALL CORRUGATED PIPE

END VIEWS

MINIMUM SUPPORT TABLE				
TILE SIZE	CHANNEL SIZE		PIPE SIZE	
3"	4" @ 5.4	#/ft	4"	STD. WT.
4"-5"	5" @ 6.7	#/ft	6"	STD. WT.
6"-9"	7" @ 9.8	#/ft	9"-10"	STD. WT.
10"	10" @ 15.3	#/ft	12"	STD. WT.

NOTE:

1. TILE REPAIR AND REPLACEMENT SHALL MAINTAIN ORIGINAL ALIGNMENT GRADIENT AND WATER FLOW TO THE GREATEST EXTENT POSSIBLE. IF THE TILE NEEDS TO BE RELOCATED, THE INSTALLATION ANGLE MAY VARY DUE TO SITE SPECIFIC CONDITIONS AND LANDOWNER RECOMMENDATIONS.
2. 1'-0" MINIMUM LENGTH OF CHANNEL OR RIGID PIPE (OPEN OR SLOTTED CORRUGATED GALVANIZED, PVC OR ALUMINUM CRADLE) SHALL BE SUPPORTED BY UNDISTURBED SOIL, OR IF CROSSING IS NOT AT RIGHT ANGLES TO PIPELINE, EQUIVALENT LENGTH PERPENDICULAR TO TRENCH. SHIM WITH SAND BAGS TO UNDISTURBED SOIL FOR SUPPORT AND DRAINAGE GRADIENT MAINTENANCE (TYPICAL BOTH SIDES).
3. DRAIN TILES WILL BE PERMANENTLY CONNECTED TO EXISTING DRAIN TILES A MINIMUM OF THREE FEET OUTSIDE OF EXCAVATED TRENCH LINE USING INDUSTRY STANDARDS TO ENSURE PROPER SEAL OF REPAIRED DRAIN TILES INCLUDING SLIP COUPLINGS.
4. DIAMETER OF RIGID PIPE SHALL BE OF ADEQUATE SIZE TO ALLOW FOR THE INSTALLATION OF THE TILE FOR THE FULL LENGTH OF THE RIGID PIPE.
5. OTHER METHODS OF SUPPORTING DRAIN TILE MAY BE USED IF ALTERNATE PROPOSED IS EQUIVALENT IN STRENGTH TO THE CHANNEL/PIPE SECTIONS SHOWN AND IF APPROVED BY COMPANY REPRESENTATIVES AND LANDOWNER IN ADVANCE. SITE SPECIFIC ALTERNATE SUPPORT SYSTEM TO BE DEVELOPED BY COMPANY REPRESENTATIVES AND FURNISHED TO CONTRACTOR FOR SPANS IN EXCESS OF 20', TILE GREATER THEN 10" DIAMETER, AND FOR "HEADER" SYSTEMS.
6. ALL MATERIAL TO BE FURNISHED BY CONTRACTOR.
7. PRIOR TO REPAIRING TILE, CONTRACTOR SHALL PROBE LATERALLY INTO THE EXISTING TILE TO FULL WIDTH OF THE RIGHTS OF WAY TO DETERMINE IF ADDITIONAL DAMAGE HAS OCCURRED. ALL DAMAGED/DISTURBED TILE SHALL BE REPAIRED AS NEAR AS PRACTICABLE TO ITS ORIGINAL OR BETTER CONDITION.

PERMANENT DRAIN TILE REPAIR

Appendix A.

Guidelines for Conducting Proper and Successful Decompaction

1. Decompaction is required when all three conditions apply.
   A. the area has been trafficked or traversed by vehicles or construction equipment, and
   B. the soil penetrometer readings are 300 psi or greater, and
   C. The soil strength (psi) in the right-of-way area is greater than that of the non-trafficked area.

2. An Environmental and/or Agricultural Inspector (AI), with experience and training in the proper identification of compacted soil and operation methods of deep decompaction tools is required to observe the daily operation of the ripper/subsoiler to ensure the conditions are appropriate for decompaction efforts and that the proper equipment is utilized and that equipment is set-up and operated correctly.

3. To achieve the most effective shatter of the compacted soil the following guidelines have been established:
   A. Conduct ripping when the soil is dry. Follow the "Soil Plasticity Test Procedures" detailed in Appendix B to determine if soil conditions are adequately dry to conduct decompaction efforts.
   B. Deep ripping shall be conducted using a ripper or subsoiling tool with a shank length of no less than 18 inches and a shank spacing of approximately the same measurement as the shank length.
   C. Use a ripper with a knife length of no less than 2 inches more than the desired depth of decompaction.
   D. To best promote revegetation and restore crop production, a total depth of 30 or more inches of soil (topsoil plus subsoil) is required.
   E. The minimum depths of decompaction stated above in 3.D. are required where possible. A safe distance from sub-surface structures (tile drains, pipelines, buried utilities, bedrock, etc.) must be maintained at all times. Where such structures exist, a lesser depth of decompaction will be required to prevent damage to equipment and the structures as well as to maintain a safe work environment. The allowable decompaction depth in these instances will be determined on a site by site basis.
   F. When the knives are in the soil to the desired depth, the tongue of the ripper should be parallel to the surface of the ground.
   G. Select a tractor that has enough horsepower to pull the ripper at a speed of 1.5 to 2 mph and whose footprint is of equal or lesser width than the ripper. Tracked equipment is preferred and typically required to achieve this criteria.
   H. The ripper shanks should not create ruts, channels, or mixing of the sub-soil with topsoil. A speed of 1.5 to 2 mph is recommended to minimize the risk of rutting and soil mixing. The ideal operating speed can vary with soil characteristics, tractor and ripping tool used. An excessive travel speed will often increase mixing of soil horizons.
   I. When the equipment is set up and operated correctly, the ripper should create a wave across the surface of the ground as it lifts and drops the soil.

J. Make one ripping pass through the compacted area. Using a penetrometer, the AI will measure the PSI between the ripped knife tracks to determine if the single ripping pass was successful. Additional passes should only be used where needed as they may reduce the effectiveness of the ripping by recompacting the soil shattered in the previous pass.

K. If the first pass does not successfully decompact the soil, additional passes will be needed. Should multiple passes of the ripper be needed to achieve decompaction between the knives tracks of the ripping tool, the subsequent passes should be positioned so the knife tracks from the previous pass are split by the second pass. If three or more passes have been made and sufficient decompaction has not yet been achieved the AI may choose to halt further decompaction efforts in that area until conditions improve or better methods are determined.

L. Following ripping, all stone and rock three or more inches in size which has been lifted to the surface shall be collected and removed from agricultural areas.

M. After ripping has been conducted, do not allow unnecessary traffic on the ripped area.

N. In agricultural lands and croplands that will not be replanted to vegetation by the Company, recommend to landowners to plant a cover crop (cereal rye, clover, alfalfa, tillage radish, turnips, etc.) following decompaction. Reduced compaction created by the ripper pass will not remain over time without subsequent root penetration. Root penetration into the shattered soil is necessary to establish permanent stabilized channels to conduct air and water into the soil profile. Two good sources for landowner cover crop education are http://www.mccc.msu.edu/CCinfo/cropbycrop.html and http://mcccdev.anr.msu.edu/. For local expertise, consult with your county's Soil and Water Conservation District /USDA Natural Resource Conservation Service (NRCS) office for cover crop selection and compliance with NRCS planting deadlines.

Appendix B.

Soil Plasticity Test Procedures

The Agricultural Inspector will test the consistency of the surface soil to a depth of approximately 4 to 8 inches using the Field Plasticity Test procedure developed from the *Annual Book of ASTM Standards, Plastic Limit of Soils* (ASTM D-4318).

1. Pull a soil plug from the area to be tilled, moved, or trafficked to a depth of 4-8 inches.

2. Roll a portion of the sample between the palms of the hands to form a wire with a diameter of one-eighth inch.

3. The soil consistency is:

   A. Tillable (able to be worked) if the soil wire breaks into segments not exceeding 3/8 of an inch in length.

   B. Plastic (not tillable) if the segments are longer than 3/8 of an inch before breaking.

4. This Procedure is to be used to aid in determining when soil conditions are dry enough for construction activities to proceed.

5. Once the soil consistency has been determined to be of adequate dryness, the plasticity test is not required again until the next precipitation event.

1.0 Introduction

Barr Engineering Co. (Barr), under authorization and contract with Apex Clean Energy, Inc. (Apex), has completed a preliminary capacity evaluation for the proposed construction delivery routes for the Lincoln Land Wind Project in Morgan County, Illinois. The project consists of a total of 107 wind turbine generators (WTG). The proposed road layout and turbine array (v31) was provided to Barr by Apex via e-mail on January 17, 2019 prior to the beginning of the investigation (Fraser, 2019).

Barr performed a preliminary capacity analysis on the public roads affected by estimated traffic associated with the project. The analysis was performed to establish the current structural capacity of the roads, to determine if the existing roads can support estimated construction traffic associated with the project, or if the existing roads require modifications (assumed to be an overlay).

This report describes the results of the field investigation and laboratory testing performed in support of the capacity evaluation of unpaved and paved roads at the project site. The following sections provide description of site geology, previous investigations related to the existing road capacity, construction traffic volume and load estimation, and road capacity analyses of unpaved (gravel) and paved roads (asphalt and composite).

The analysis described herein for the public roadways was performed based on limited field and laboratory data and Barr's experience with similar projects. This report shall be considered preliminary, therefore, additional testing and analysis are necessary for final rehabilitation recommendations. The intent of this preliminary capacity analysis was to provide Apex with an indication of the estimated current capacity of the public roads, and to determine if additional structural capacity is required at the site to accommodate anticipated construction traffic.

1.1 Site Location

The Lincoln Land Wind Project is located in eastern Morgan County, east of the city of Jacksonville, as shown on Figure 1. The project site and proposed wind turbine locations at the time of this report are shown on Figure 2. The coordinates of the road borings locations are included in Appendix A.

1.2 Site Geology

1.2.1 Physiographic Information

The proposed wind project site is located in the Central Lowland or Interior Plains physiographic region of the central United States (Fenneman and Johnson, 1946). Specifically, the project site is located in the Springfield Plain region of Illinois. The landscape consists of gently rolling hills which were carved and leveled by glaciers during the last Ice Age.

1.2.2 Geologic History

The area of Illinois was beneath shallow tropical seas from about 325 to 540 million years ago. During these conditions, sedimentary rock sequences formed. The dominant rock types during this period were

limestone/dolomites and sandstones of the Cambrian, Ordovician, Silurian, Devonian, and Mississippian Periods. Tectonically, roughly the center of Illinois is subsiding, creating a bowl-shaped basin, which continues to fill with sediment.

At about 325 million years ago, the landscape has changed to a swampy delta of the Pennsylvanian Period. Muddy rivers flowed across the delta depositing sediments that would become shales and mudstones. Through time, the forests in the swamps were buried and compacted to become the minable coal of Illinois. During the Pennsylvanian Period, the rock layers in Illinois faulted and folded, bringing the rock layers to the surface.

During the glacial periods, older glaciers (Kansan, Nebraskan, and Illinoisan) covered much of the state. The final glacial episode, the Wisconsinan, only covered the northeastern third of the site (which does not include the project area). In the areas where the Wisconsinan glaciers did not cover, a blanket of loess (wind-blown silts) of varying thickness was deposited on the underlying older glacial till or bedrock.

1.2.3 Surficial Geology

The Quaternary geology at the site generally can be observed in the following order by age: alluvium and terrace deposits, loess, and glacial till and outwash deposits (IGS, 2018).

The site is mapped as having 2.5 to 5.5 meters of loess over the project area (Kohfield and Muhs, 2001). The USDA Soil Survey indicates that the site is covered by silty clay loam, silt loam, and clay loam type soils. The USCS Classifications of the soils at the site are typically mapped as ML (silt) and MH (elastic silt), with lesser areas of CL (lean clay) (NRCS, 2018). However, it is anticipated from experience that most of the soil types encountered at the site will consist of lean clay (CL) with areas of sandy alluvial soils associated with stream courses.

1.2.4 Bedrock Geology

The bedrock at the site is mapped primarily as the Shelburn-Patoka Formation, with a small area mapped as Carbondale Formation in the far northeast corner of the project area (Kolata, 2005). The Carbondale and Shelburn and Pakota Formations are primarily shale with sandstone, limestone, and coal interbeds.

Depth to bedrock is mapped at on the order of 25 to 50 feet below existing grades.

Karst features are typically observed in the northwest corner and western/southern edge of Illinois. There is karst potential mapped at the far western edge of Morgan County, but not in proximity to the site.

1.2.5 Groundwater/Flooding

The project area consists of loess over older glacial soils and/or bedrock. It is anticipated that the loess soils will allow for infiltration of the groundwater until a restrictive layer is reached. That restrictive layer may be an older or more clayey zone of loess, or the underlying clayey glacial till or bedrock. Most of the area is mapped as three feet or less to a seasonal groundwater table. However, typically more variation is observed in water levels across the site.

Review of FEMA flood mapping indicates that the only areas listed with potential flooding at the site are located in the major site drainage ways and not over the majority of the site area (FEMA, 2018).

1.3 Previous Investigations

Barr provided a geotechnical desktop study of the project site for Apex in April of 2018 (Barr, 2018a). Barr performed a preliminary phase geotechnical investigation for the project site, including wind turbines and other associated electrical infrastructure, and submitted a report to Apex in October of 2018 (Barr, 2018b). As part of the preliminary geotechnical investigation, Barr performed 40 geotechnical borings along the existing public roadways (Appendix C), these borings are used in this road assessment.

1.4 Roadway Nomenclature

In this report (including all tables, figures, and appendices), investigation locations are identified using the public road names as indicated on Figure 3.

2.0 Investigation Methods

The investigation and evaluation consisted of complementing the existing geotechnical investigation with additional geotechnical borings, pavement coring, standard penetration tests (SPT), split-spoon soil sampling, bulk soil sampling, and laboratory testing. This information was used to evaluate the capacity of the existing public roads along the proposed delivery routes. The site investigation was conducted in February of 2018. Laboratory testing was completed in February of 2018 (Appendix B). Figure 4 shows the extents of the investigated areas.

2.1 Field Investigations

The following sections discuss the field work performed at the project site.

2.1.1 Road Borings

A total of 35 road borings were selected by Barr to complement the existing set of geotechnical borings (Figure 4). The criteria used for the selection of the borings was to obtain at least one boring per road to be evaluated. On roads where the delivery route extended over three miles, additional borings were selected (e.g. Old Route 36) to verify the continuity of the road section. Borings along the existing public roadways were extended to a target depth of approximately 5 feet. These borings were performed in alternating traffic lanes to estimate pavement and base course thickness. The geographic coordinates of the boring locations are provided on the boring logs in Appendix A.

Soil borings were performed by GEOCON Professional Services of Frankfort, Illinois, under subcontract to Barr. The borings were advanced using augers. Measurements were made of the pavement and/or aggregate base thickness.

As requested by Apex and the County, 18 locations were cored to minimize damage to the roads. Barr field staff measured the pavement cores and visually inspected the cores for signs of structural distress during field investigation. The remaining locations were investigated using auger techniques and intact cores were not obtained.

Soil sampling and classification was performed continuously below the pavement layers to a depth of 5 feet. The split spoon sampling and standard penetration testing was performed in accordance with ASTM D1586. The samples were sealed in the field in order to preserve the in-situ moisture content.

The soil samples were transported to Soil Engineering Testing Inc. (SET) in Bloomington, Minnesota, for laboratory testing. The geotechnical boring logs are provided in Appendix A.

2.1.2 Bulk Sample Collection

A total of five bulk samples were collected from the boreholes for laboratory testing. The criteria used for the selection of the bulk sample locations was to obtain spatially representative samples to characterize the site. The bulk samples were collected from a depth of about 1 to 3 feet (below the pavement

materials) and placed in sealed 5-gallon buckets to preserve the in-situ moisture content. The samples were delivered to SET for laboratory testing.

2.2 Laboratory Testing

The following tests were performed by SET:

- Moisture content testing in accordance with ASTM D2216, "Standard Test Method for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass"
- Standard Proctor density determination in accordance with ASTM D698, "Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft^3 (600 kN-m/m^3))"
- California Bearing Ratio tests in accordance with ASTM D1883, "Standard Test Method for CBR (California Bearing Ratio) of Laboratory-Compacted Soils"

The laboratory testing results are provided in Appendix B.

3.0 Public Roads Capacity Study

This section focuses on determining the estimated load capacity of the existing public unpaved (gravel) and paved (asphalt and composite) roads. This section includes recommendations regarding structural improvements (i.e., overlay) required to accommodate anticipated construction traffic.

3.1 Existing Public Road Sections

Subsurface conditions were determined by road borings from the geotechnical investigation. The completed boring logs are located in Appendix A. For completeness, the boring logs from the preliminary geotechnical investigation are included in Appendix C (Barr, 2018b).

Based on the results of the geotechnical borings performed along the anticipated delivery route, the existing public roads generally consisted of paved and gravel roadways. Paved roads generally consisted of asphalt and/or a thin layer of chipseal. The total pavement thickness ranged from approximately 1.25 to 15 inches thick, with a typical range of 4 to 6 inches. The aggregate base thickness was measured to range from 2 to 9 inches in thickness, with a typical range of about 4 to 6 inches. An aggregate base layer was not observed at several locations.

Borings RD17, RD22, RD28, RD34, RD35, RD65, and RD75 along the existing public roads were identified as gravel roads, with a surficial aggregate base that ranged from 2 to 7-inches thick. The subgrade was generally observed to consist of lean clay soil.

Figure A shows the three main types of road sections observed at the site, and Table A shows the measurements obtained from the field investigation.

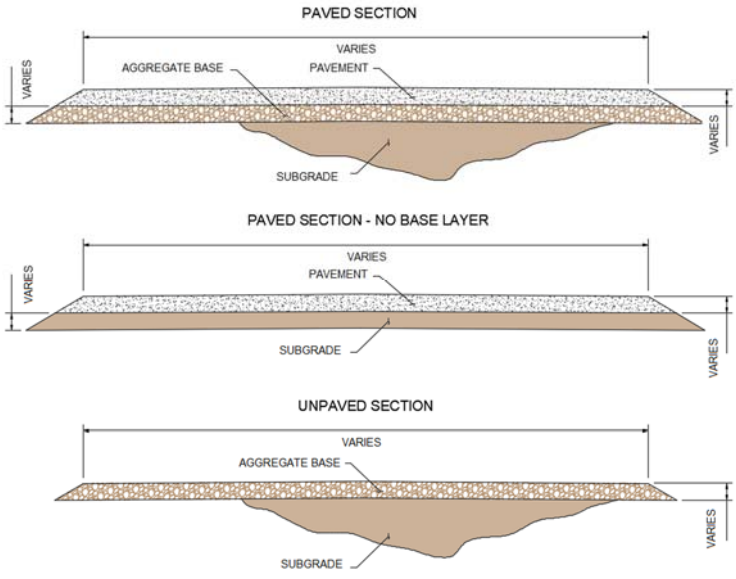

Figure A - Typical Road Sections

RD76	Oxley Road	-	1.8	-	5.0

SPT *N* values ranged from 5 to 38 blows per foot, with a typical range of about 8 to 15 blows per foot. Hand penetrometer test results indicated that the unconfined compressive strength ranged from 0.5 to 4.5 tons per square foot (tsf), with most measurements ranging between 1.0 to 3.0 tsf. In general, the hand penetrometer measurement on the shallower sample was higher than the measured for the deeper samples, indicating that either some amount of compaction during construction or compaction from traffic has stiffened the material. This trend was noted for the recent and preliminary field investigation, which were performed during a different time of the year. These values are not directly used in the capacity analysis, however, they support the field observations and laboratory testing.

At boring locations RD08 and RD50, an asphalt layer was observed overlying a concrete section (i.e., AC/PCC composite pavement).

At boring RD04 (Barr, 2018b), a buried pavement layer was observed at a depth of approximately 3.5 feet below the existing roadway.

3.2 California Bearing Ratio Testing

Five spatially representative samples were collected from the subgrade below the pavement section from the project site (Figure 5). The CBR tests were performed per the recommendations of ASTM D1883. The samples were tested in the soaked condition at approximately 95% of maximum dry density and optimum moisture content. Apex also requested performing CBR testing using in-situ moisture content condition in the unsoaked condition. The results of laboratory California Bearing Ratio (CBR) testing indicated that the CBR values under a surcharge of 50 pounds per square foot (psf), and corrected for 0.1 inches of penetration, ranged from approximately 3.9 to 8.3 percent at optimum moisture content. Under in-situ moisture conditions, the CBR values ranged from approximately 3.0 to 9.9 percent.

Table B – California Bearing Ratio Results

Boring ID	Road	CBR % (Optimum)	CBR % (In-Situ)
RD44	Bluegrass Road	4.1	9.9
RD52	Old Route 36	8.3	3.1
RD59	Loami Road	4.0	**4.2***
RD68	Yording Road	**3.9***	3.0
RD69	Colwell Road	4.8	4.2

***Selected values for analysis**

The in-situ moisture content of the material was observed to be generally higher than the optimum moisture content as measured according to the standard Proctor test. In general the in-situ CBR test results did not show a substantial increase in subgrade strength, except for the CBR at RD44, where soil type was different in comparison to the other materials tested.

Upon review of Proctor and CBR testing results of representative samples of the site, CBR design values of 3.9% and 4.2% were selected for the capacity analysis for the optimum and in-situ moisture contents, respectively. This values were used for back-calculation of the resilient modulus (M_r) of the subgrade.

For conservatism, the CBR value selected for the optimum moisture condition corresponds to the lowest measured value. The CBR value for the in-situ condition was selected as the value that occurs most often in the data set (mode). It could be expected that road sections that are near capacity would potentially require an overlay if the in-situ CBR was measured to be closer to the low boundary (i.e. 3.0%). Conversely, road sections with an in-situ CBR closer to the upper boundary (i.e. 9.9%) may not require an overlay.

Given the substantial reduction of CBR values for Old Route 36, the scenario with a CBR of 3.1% was also evaluated to fully discard the need of an overlay using the CBR value of the in-situ condition. Note that the standard of practice for pavement design is to use CBR values with the optimum moisture under a soaked condition, as it typically represents the worst condition for the subgrade strength and stiffness.

Figure B shows a schematic representation of the impacts that moisture content has on the dry density of the soil. It can observed that as the moisture content moves away from the peak of the curve, the density

of the material is reduced. This has a direct effect on the CBR results, and consequently the structural number for a given road.

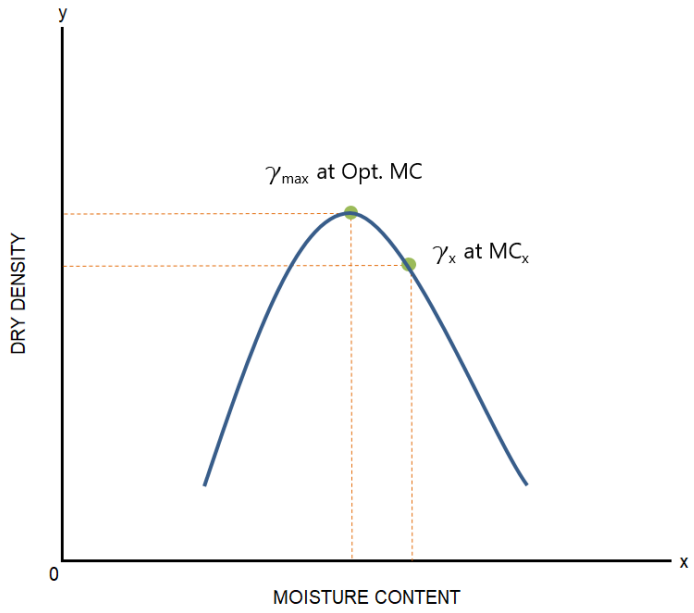

Figure B – Moisture-Density Relationship Curve

The soil types tested consisted of lean clay, fat clay, and clayey sand based on visual observations, but specific laboratory index testing to classify the soil was not performed. Only one sample was classified as sand, which confirms the results of the borings, indicating that the majority of the subgrade is comprised of clayey soil.

3.3 Preliminary Structural Capacity of Roads

This section focuses on determining the estimated load capacity of the existing roads and if required pre-construction rehabilitation needed to accommodate anticipated construction traffic. Each road section analyzed was assigned a unique identifier which are shown in Figure 6. It is important to note that this preliminary analysis is based on limited discrete testing. Final rehabilitation assessment should be made based on continuous testing such as the falling weight deflectometer (FWD) test.

3.3.1 Existing pavement structure

The existing layer thicknesses for road capacity analysis were determined based on road borings and interpretation from field observations (refer to Section 3.1). Gravel thickness for unpaved roads, asphalt/concrete thickness and base thickness for (see Table A) paved roads were estimated from road borings provided in Appendix A and Appendix C.

3.3.2 Subsurface Conditions

Subsurface conditions were determined by borings and cores completed during the site investigation. Based on field testing and observations. The subgrade generally consists of clayey soil, with very isolated areas of sandy soil. The boring logs are located in Appendix A and Appendix C.

3.3.3 Traffic Assumptions (ESAL Determination)

Anticipated delivery routes were developed based on information provided by Apex, and Barr's understanding of the project. Truck counts (traffic volume) were then estimated based on these anticipated construction routes. Appendix D includes the summary of the traffic count determination and Appendix E includes estimation of ESALs from the traffic count and assumed construction and delivery truck types. The following assumptions were used for the estimation of the truck counts:

- Turbine components will be delivered directly to each turbine location. Components will be delivered to the northern portion of the site (approximately two thirds of the total turbines) via Interstate 72 and heading north or south on County Highway 123/State Highway 123. Components will be delivered to the southern portion of the site (approximately one third of the total turbines) via Interstate 72, heading west on Old Route 36, and heading southeast on Illinois 104. See Figure 7 for a representation of this route.

- Concrete will be delivered directly to each turbine location. Concrete will be delivered to the northern portion of the site (approximately two thirds of the total turbines) via Interstate 72 and heading north or south on County Highway 123/State Highway 123. Concrete will be delivered to the southern portion of the site (approximately one third of the total turbines) via Interstate 72, heading west on Old Route 36, and heading southeast on Illinois 104. Concrete for turbines T12, T15, T16, and T18 will be delivered via Interstate 72 and heading east on Old Route 36. See Figure 8 for a representation of this route.

- Structural steel will be delivered directly to each turbine location. Steel will be delivered to the northern portion of the site (approximately two thirds of the total turbines) via Interstate 72 and heading north or south on County Highway 123/State Highway 123. Steel will be delivered to the southern portion of the site (approximately one third of the total turbines) via Interstate 72, heading west on Old Route 36, and heading southeast on Illinois 104. See Figure 9 for a representation of this route.

- Aggregate will be delivered to the northern portion of the site (approximately two thirds of the total turbines) via Interstate 72 and heading north or south on County Highway 123/State Highway 123. Aggregate will be delivered to the southern portion of the site (approximately one third of the total turbines) via Interstate 72, heading west on Old Route 36, and heading southeast on Illinois 104. See Figure 10 for a representation of this route.

- Water will be delivered to the northern portion of the site (approximately two thirds of the total turbines) via Interstate 72 and heading north or south on County Highway 123/State Highway 123. Water will be delivered to the southern portion of the site (approximately one third of the

total turbines) via Interstate 72, heading west on Old Route 36, and heading southeast on Illinois 104. See Figure 11 for a representation of this route.

- Crane parts for the northern portion of the site will be delivered to T14 and picked up from T95 via Interstate 72 heading north on County Highway 123. Crane parts for the southern portion of the site will be delivered to T96 via Interstate 72 and heading south on State Highway 123 and picked up from T47 via Interstate 72, heading west on Old Route 36, and heading southeast on Illinois 104.

Traffic volume and loading for the roadways analyzed were estimated based on typical construction processes, and Barr's previous experience with similar wind farm projects.

The following are the main assumptions used for estimation of traffic volume and loading:

- For design purposes, truck traffic was converted to loading which is normalized by the concept of an equivalent single axle load (ESAL).
- No local traffic was accounted for in the capacity analysis, only wind farm construction traffic.
- Based on Barr's previous experience with gravel roads, an average axle load of 18.25 kips was assumed.
- Truck axle configurations (for construction and delivery vehicles) were assumed based on turbine manufacturer guidelines and Barr's previous experience on similar projects.

The ESALs used for the capacity analysis can be found in Appendix E.

3.4 Gravel and Asphalt Roads

Gravel and asphalt road analysis was performed following the Giroud-Han method (Giroud and Han, 2004) and the guidelines in the *AASHTO Guide for Design of Pavement Structure* method (Huang, 2004), respectively. Details and equations for these two methods are presented in Appendix F.

3.4.1 Assumptions

In addition to the assumptions listed in the traffic volume and loading analysis section, the following assumptions were made for the capacity analysis of public roads:

- The initial serviceability after construction of pavement structure (p_0), or overlay of an existing pavement section, is assumed to be 4.2. The terminal serviceability is assumed to be 2.5 (p_t). These assumptions are based on recommendations in *Pavement Analysis and Design* (Huang, 2004).
- A 1.7 allowable serviceability index loss (ΔPSI) was used for the analysis. This value corresponds to the difference between the after-construction serviceability index and the terminal serviceability index selected for the analysis.

- AASHTO defines reliability as the probability that the load applications a pavement can withstand in reaching a specified minimum serviceability level is not exceeded by the number of load applications that are actually applied to the pavement. For this project, a reliability of 90 percent was assumed for asphalt roads with relatively high local traffic. A reliability of 80 percent was assumed for local asphalt roads with relatively low traffic. These assumptions were based on recommendations in *Pavement Analysis and Design* (Huang, 2004). Table 1 and Table 2 show the reliability used for each road section.

- In the AASHTO method, the overall standard deviation is a measure of the spread of the probability distribution for ESALs vs. Serviceability. For this project, an overall standard deviation of 0.35 was assumed based on recommendations in *Pavement Analysis and Design* (Huang, 2004) and Barr's previous experience.

- The structural coefficient a_1 for asphalt material (i.e., current asphalt layer and potential overlay material) is assumed to be 0.36 based on recommendations in *Pavement Analysis and Design* (Huang, 2004).

- The structural coefficient a_2 for base material is assumed to be 0.10 based on recommendations in *Pavement Analysis and Design* (Huang, 2004).

- Drainage coefficient m_2 for base material is assumed to be 1.0 based on recommendations in *Pavement Analysis and Design* (Huang, 2004) for fair quality of drainage and 5-25% of time pavement structure is exposed to moisture levels approaching saturation.

- A subgrade resilient moduli (M_R) of 5850 psi and 6300 psi was estimated from CBR testing of subgrade material at five locations using Heukelom and Klomp (1962) correlation. This was estimated using CBR values of 3.9% and 4.2%, respectively.

- A tire pressure of 100 psi was assumed (for Giroud-Han gravel road method).

- Maximum rut depth of 3.0 inches was assumed as performance criteria for existing public unpaved roads.

3.4.2 Existing Structural Capacity

The existing structural capacity is represented by the effective structural number for paved roads and by gravel thickness for unpaved roads. The effective structural number (for paved roads) and gravel thickness (for unpaved roads) for the sections analyzed is shown in Table 1 (optimum moisture condition) and Table 2 (in-situ condition).

3.4.3 Required Capacity

The required capacity (i.e., structural number for paved roads and gravel thickness for unpaved roads) computed for each road section to support the anticipated construction traffic is provided in Table 1 (optimum moisture condition – CBR=3.9%) and Table 2 (in-situ condition CBR=4.2%). Based on Barr's analysis, several sections at the site require additional capacity to support anticipated construction traffic.

The required estimated overlay thicknesses were computed using the equations presented in Appendix F. Note that the calculated overlay required for additional capacity is rounded-up to the nearest 0.5 inch. While this value theoretically complies with the numerical requirements, local authorities may require a minimum overlay thickness. The mix design (for asphalt roads) or aggregate size will also influence the minimum overlay thickness. Barr's scope and recommendations are based only on the structural capacity analysis herein, and does not consider local codes or construction recommendations.

3.5 Composite (AC/PCC) Roads

Composite (AC/PCC) roadway capacity analysis was performed following the guidelines in the *AASHTO Guide for Design of Pavement Structure* method (Huang, 2004). Details and equations for this method are presented in Appendix G.

3.5.1 Assumptions

In addition to the assumptions listed in Sections 3.3.3 and 3.4.1, the following assumptions were made for the composite roadway analysis:

- The Portland cement concrete modulus of rupture, S_c, is assumed to be 350 psi based on recommendations in *Pavement Analysis and Design* (Huang, 2004).
- The load transfer coefficient, *J*, is assumed to be 4.1 based on recommendations in *Pavement Analysis and Design* (Huang, 2004).
- Drainage coefficient, C_D, is assumed to be 0.95 based on recommendations in *Pavement Analysis and Design* (Huang, 2004) for fair quality of drainage and 5-25% of time pavement structure is exposed to moisture levels approaching saturation.
- Joints/cracks adjustment factor, F_{jc}, is assumed to be 0.9 based on recommendations in *Pavement Analysis and Design* (Huang, 2004).
- Durability adjustment factor, F_{dur}, is assumed to be 0.95 based on recommendations in *Pavement Analysis and Design* (Huang, 2004). It is assumed that there is some durability distress in the Portland Cement Concrete.
- Existing asphalt quality adjustment factor, F_{ac}, is assumed to be 0.95 based on recommendations in *Pavement Analysis and Design* (Huang, 2004). It is assumed that there is some existing asphalt distress.

3.5.2 Existing Structural Capacity (D_{eff})

The existing structural capacity (represented by the effective concrete thickness, D_{eff}) of the composite road sections selected as delivery route is shown in Table 3 (optimum moisture condition) and Table 4 (in-situ condition). Existing capacity of the composite sections was calculated using the standard AASHTO method presented in Appendix G.

3.5.3 Required Structural Capacity

The required structural capacity computed for each composite section after accounting for the estimated construction traffic is shown in Table 3 (optimum moisture condition) and Table 4 (in-situ condition). For the subgrade conditions investigated and assumed construction traffic volume, none of the three composite sections require an overlay.

3.6 Summary

Based on this preliminary capacity analysis, several road sections require additional capacity to withstand the anticipated traffic associated with the construction of the project. The summary table presented below shows the estimated required overlay to increase the capacity of these roads.

Table C – Estimated Required Overlay

ID	Roadway	From	To	Type	CBR=3.9% Overlay Thickness (inches)	CBR=4.2% Overlay Thickness (inches)
001	York Road	Lindsey Road**	Twyford Road	Chipseal	0.5	0.5

3.7 Analysis Limitations

The road capacity analysis described herein for the public roadways was performed based on Barr's experience with similar projects. The intent of this preliminary capacity analysis was to determine if additional structural capacity is required at the site to accommodate anticipated construction traffic.

The capacity analyses are highly dependent on the parameters selected and assumptions used. Barr has not confirmed the assumptions necessarily comply with the minimum requirements of the governing road agencies. The project civil engineer in charge of the final rehabilitation assessment or the owner is responsible for determining if the assumptions outlined in this report comply with the minimum requirements of the governing road agencies. This report shall be considered preliminary, therefore, additional analysis may be necessary pending input from governing road agencies, and shall be performed prior to final road rehabilitation recommendations. This report contains recommendations for road improvements and these recommendations need to be verified by the civil design professional serving as the Engineer of Record (EOR) for the roadways.

Appendix F

AASHTO Method for Capacity Evaluation of Asphalt Roads and Giroud-Han Method for Gravel Roads

The widely used AASHTO empirical equation for design of flexible pavement relates the traffic loading (i.e., ESALs) to the structural capacity (SN) of the pavement, the stiffness of the subgrade, and the serviceability of the road. The design equation has the following form:

$$\log_{10}(W_{18}) = Z_R \times S_o + 9.36 \times \log_{10}(SN+1) - 0.20 + \frac{\log_{10}\left(\frac{\Delta PSI}{4.2-1.5}\right)}{0.40 + \frac{1094}{(SN+1)^{5.19}}} + 2.32 \times \log_{10}(M_R) - 8.07$$

where;

	W_{18}	=	number of 18-kip equivalent single axle loads (ESALs)
	Z_R	=	standard normal deviate (function of the design reliability level)
	S_0	=	overall standard deviation (function of overall design uncertainty)
	ΔPSI	=	allowable serviceability loss at end of design life
	M_R	=	subgrade resilient modulus
	SN	=	structural number (a measure of required structural capacity)

After estimating the structural capacity required for construction/delivery wind farm traffic (SN_{req}) using the AASHTO equation above, the required asphalt overlay thickness needed to upgrade existing roads to meet serviceability can be calculated using the following equation:

$$Required\ Overlay\ Thickness = \frac{SN_{req} - SN_{eff}}{a_1}$$

where,

SN_{req} = Required structural number computed using AASHTO equation with wind farm construction traffic and M_R of subgrade

SN_{eff} = existing (or effective) structural number of road.

a_1 = structural coefficient for asphalt mixes, assumed 0.36 based on Huang (2004).

For gravel roads, the aggregate thickness required to support the construction traffic was determined utilizing the Giroud-Han iterative equation (Giroud and Han, 2004):

$$h = \frac{0.868 + \left(0.661 - 1.006J^2\right)\left(\frac{r}{h}\right)^{1.5}\log N}{\left[1 + 0.204\left(\frac{3.48CBR_{bc}^{0.3}}{CBR_{sg}} - 1\right)\right]}\left(\sqrt{\frac{\frac{P}{\pi r^2}}{\frac{s}{f_s}\left[1 - 0.9e^{-\left\{\frac{r}{h}\right\}^2}\right]N_c f_c CBR_{sg}}} - 1\right)r$$

where:

h = recommended thickness (meters)

J = aperture stability modulus (m-N/degree), zero for roads without geotextile reinforcement

P = wheel load = axle load/2

r = radius of tire print

N = number of axle passes

CBR_{sg} = Subgrade CBR

CBR_{bc} = Aggregate Base CBR

f_s = rut depth factor = 75 mm

s = maximum rut depth allowed, it was assumed 3 in.

N_c = bearing capacity factor (3.14 for unreinforced roads, 5.14 for geotextile reinforced roads, and 5.71 for geogrid reinforced roads)

f_c = factor relating CBR of subgrade to equivalent c_u value = 30

Appendix G

AASHTO Method for Capacity Evaluation of Composite (AC/PCC) Roads

AASHTO Method for Capacity Evaluation of Composite (AC/PCC) Roads The widely used AASHTO empirical equation for design of Portland cement concrete roads relates the traffic loading (i.e., ESALs) to the thickness of the pavement, the stiffness of the subgrade, and the serviceability of the road. The design equation has the following form:

$$\log(W_{18}) = Z_R S_0 + 7.35\log(D+1) - 0.06 + \frac{\log\left[\frac{\Delta PSI}{4.5-1.5}\right]}{1+\frac{1.624\times10^7}{(D+1)^{8.46}}} + (4.22-0.32p_t)\log\left[\frac{S_c C_d\left(D^{0.75}-1.132\right)}{215.63J\left[D^{0.75}-\frac{18.42}{\left(E_c/k\right)^{0.25}}\right]}\right]$$

where;

	W_{18}	=	number of 18-kip equivalent single axle loads (ESALs)
	Z_R	=	standard normal deviate (function of the design reliability level)
	S_0	=	overall standard deviation (function of overall design uncertainty)
	ΔPSI	=	allowable serviceability loss at end of design life
	p_t	=	serviceability at time *t*, assumed as 2.5.
	k	=	modulus of subgrade reaction (pci)
	D	=	slab thickness (in)
	S_c	=	modulus of rupture of concrete (psi)
	E_c	=	modulus of elasticity of concrete (psi)
	C_d	=	drainage coefficient
	J	=	load transfer coefficient

After estimating the structural capacity required for construction/delivery wind farm traffic (D_f) using the PCC AASHTO equation above, the required asphalt overlay thickness needed to upgrade existing PCC roads to meet serviceability can be calculated using the following equation:

$$Required\ AC\ Overlay\ Thickness = A(D_f - D_{eff})$$

where, D_f = required PCC slab thickness using AASHTO equation with local and wind farm construction traffic and modulus of subgrade reaction (k)

D_{eff} = effective existing PCC slab thickness.

A = factor to convert PCC thickness to AC overlay thickness

= $2.2233 + 0.0099\left(D_f - D_{eff}\right)^2 - 0.1534\left(D_f - D_{eff}\right)$

Effective existing PCC slab thickness (D_{eff}) can be computed with the following equation:

$$D_{eff} = F_{jc} D_{existing}$$

where, $D_{existing}$ = existing PCC slab thickness

F_{jc} = joints and cracks adjustment factor. Ranges from 0.9-1.0 depending on the level of deterioration of existing PCC pavement

Structural capacity evaluation of composite pavements (AC/PCC) with AASHTO method follows the same procedure and equations outlined above with exception of the equation to estimate D_{eff} (Effective existing PCC slab thickness).

Effective existing PCC slab thickness (D_{eff}) for composite pavements (AC/PCC) can be computed with the following equation:

$$D_{eff} = F_{jc} F_{dur} D_{existing} + \frac{D_{ac}}{2} F_{ac}$$

where, $D_{existing}$ = existing PCC slab thickness

F_{jc} = joints and cracks adjustment factor. Ranges from 0.9-1.0 depending on the level of deterioration of existing PCC pavement

F_{dur} = durability adjustment factor for PCC

D_{ac} = thickness of existing AC surface layer

F_{ac} = existing asphalt quality adjustment factor. Depends on existing AC distresses such as rutting, stripping, raveling, etc.

ENGINEERING REPORT
CONCERNING THE EFFECTS UPON
FCC LICENSED RF FACILITIES
DUE TO CONSTRUCTION OF THE
LINCOLN LAND WIND ENERGY PROJECT
In
MORGAN COUNTY, ILLINOIS

I. INTRODUCTION

This engineering report describes the results of a study and analysis to determine the locations of federally-licensed (FCC) fixed station radio frequency (RF) facilities that may be adversely impacted as a result of the construction of the Lincoln Land Wind Energy Project in Morgan County, Illinois. This document describes impact zones and any necessary mitigation procedures, along with recommendations concerning individual wind turbine siting. All illustrations, calculations and conclusions contained in this document are based on FCC database records.

Frequently, wind turbines located on land parcels near RF facilities can cause more than one mode of RF impact, and may require an iterative procedure to minimize adverse effects. This procedure is necessary in order to ensure that disruption of RF facilities either does not occur or, in the alternative, that mitigation procedures will be effective. The purpose of this study is to facilitate the siting of turbines to avoid such impact.

The Lincoln Land wind project as currently planned involves the construction of up to 107 wind turbines, the exact number depending on the turbine model chosen[1], in an area about nine miles east of the City of Jacksonville in Morgan County, Illinois. Out of the four turbine models that are being considered, the tallest hub height will be 114 meters and the largest rotor diameter will be 150 meters. Whatever turbine model is chosen, the maximum blade tip height will be 182.5 meters AGL. The model used for the following analyses is the one utilizing the 150-meter diameter rotor.

Using industry standard procedures and FCC databases, a search was conducted to determine the presence of any existing land mobile stations, including public safety station, in and near the subject property and TV broadcast signals receivable in the area. A specific turbine layout has

[1] The turbine layout shown in this report is comprised of 119 primary and alternate turbine sites.

been submitted for analysis. Accordingly, this report will address the potential conflicts that may be caused by the individual proposed turbines.

The following tabulation and analysis consists of three sections:

1. Land mobile and public safety stations
2. Broadcast TV Stations
3. NTIA notification

The attached figures were generated based upon the operating parameters of the FCC-licensed stations as contained in the FCC station database, with corrections of the antenna locations as needed.

The following analysis examines the pertinent FCC licensed services in the area for impact. This analysis assumes that all licensed services have been designed and constructed according to FCC requirements and good engineering practice.

Each of the RF analyses is described separately in the sections that follow.

II. ANALYSIS OF LAND MOBILE & PUBLIC SAFETY RADIO FACILITIES

A search of the FCC's land mobile/public safety radio database revealed 53 land mobile transmitter stations that fall within the search area (about 2.0 miles beyond the project area). These land mobile stations are listed below in Table 1 (public safety and other government service stations are highlighted in blue) and mapped in Figure 1[2]. The specifications on the land mobile stations can be found in the associated land mobile (LM) spreadsheet file.

Table 1 – Land Mobiles Stations within 2 Miles of Project Area

The far-field region of a transmitting antenna is defined as the distance just far enough from the antenna such that the shape of the radiation pattern of the antenna doesn't change with increased distance from the antenna, unlike in the near-field (although the *strength* of the received signal in the far-field decreases with increased distance). An object near the antenna that has highly conductive properties, such as a wind turbine with a metal supporting tower, may cause distortion of the antenna's radiation pattern if it is located in the antenna's near-field. Thus, in general, a turbine should not be sited inside the edge of the far-field region of a land mobile transmitting antenna.

The distance R_{ff} to the edge of the far-field region of an antenna, also known as the Fraunhofer distance, can be calculated using the following equation:

$$R_{ff} = 2D^2/\lambda$$

where D is the length of the antenna and λ is the wavelength at the operating frequency.

Since the length of the antenna and the frequency are usually known, we can utilize this equation to establish setback distances from omni-directional[3] land mobile stations. Evans Engineering Solutions uses a modified form of the above equation, substituting "3" for "2" as the coefficient in the equation. This increases the setback 50% to provide additional protection by reducing the antenna aperture blockage presented by the wind turbine support towers.

By using worst-case assumptions of frequency and antenna length, we can arrive at a worst-case setback for the purpose of performing an initial "screening" for potential land mobile

[3] "Omni-directional" transmitting stations operate with nearly equal levels of RF energy in all directions, unlike, for example, point-to-point microwave stations which transmit RF energy in one discrete direction.

interference by wind turbines. Let us assume that a land mobile station, whether licensed or unlicensed, could operate on a frequency up to 965 MHz and utilize an antenna up to 20 feet in length (commercially available antennas that operate omni-directionally at this frequency are usually less than 10 feet long). The wavelength λ at 965 MHz is 1.02 feet. Thus, in the modified Fraunhofer equation, the turbine setback is calculated as follows:

$$R = 3(20)^2/1.02 = 1{,}176 \text{ feet}$$

Converting to metric, the worst-case setback R is 359 meters. Since each rotor blade, which contains metallic (thus conductive) components, extends out up to 75 meters from the turbine tower (assuming the largest turbine considered for the Lincoln Land project, measured from the rotor hub to the tip of the blade), we add this length to R to get a recommended spacing from any land mobile antenna structure to the turbine tower, which becomes 434 meters. It is the practice of this firm to round up setback distances to the nearest number divisible by 25; thus, 450 meters is recommended as the setback distance between a land mobile tower and the nearest turbine. However, if a turbine is sited less than the recommended setback from a land mobile station and there are no acceptable options that would meet the setback, we then use the actual highest operating frequency and antenna length to calculate an alternative setback, which is almost always less than the worst-case spacing.

None of the land mobile stations listed in Table 1, if the locations listed on their FCC licenses are correct, are within 450 meters of any planned Lincoln Land turbine site, based on the currently proposed layout (see Figures 1 through 2). The closest station to any planned turbine is shown in Figure 2.

The reader is referred to the provided KMZ file for more magnification and closer inspection.

Based on the current project layout, and assuming that the land mobile stations in and near the project area are actually located at their licensed locations, or located farther away from turbines, no adverse impact is expected to be caused to the transmissions of land mobile or public safety stations that are licensed by the FCC.

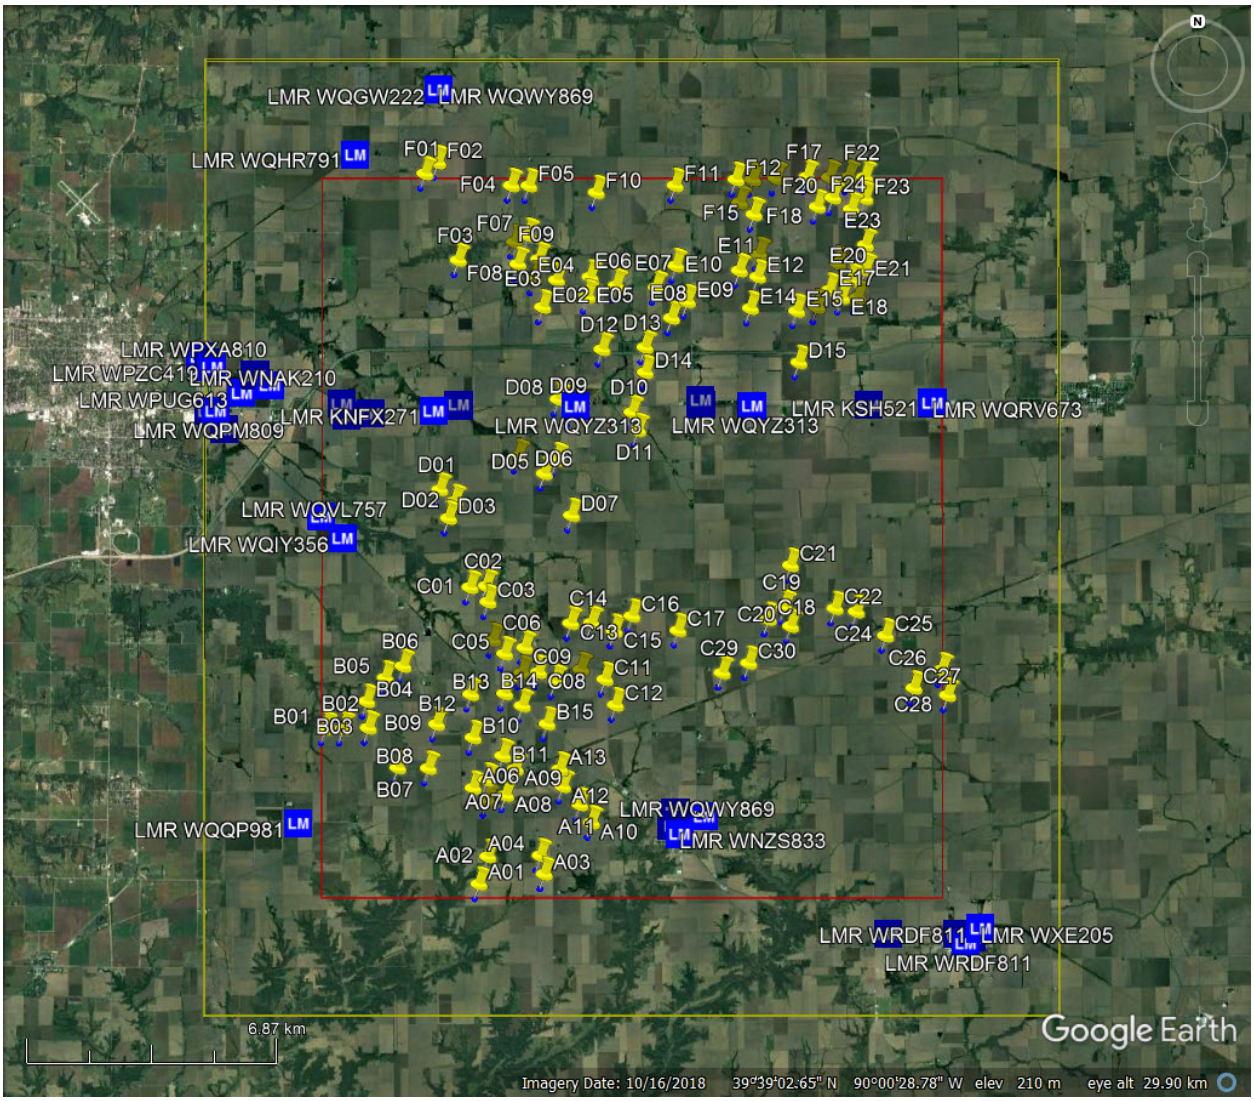

Figure 1 – Land Mobile Stations in or near Lincoln Land Project Area

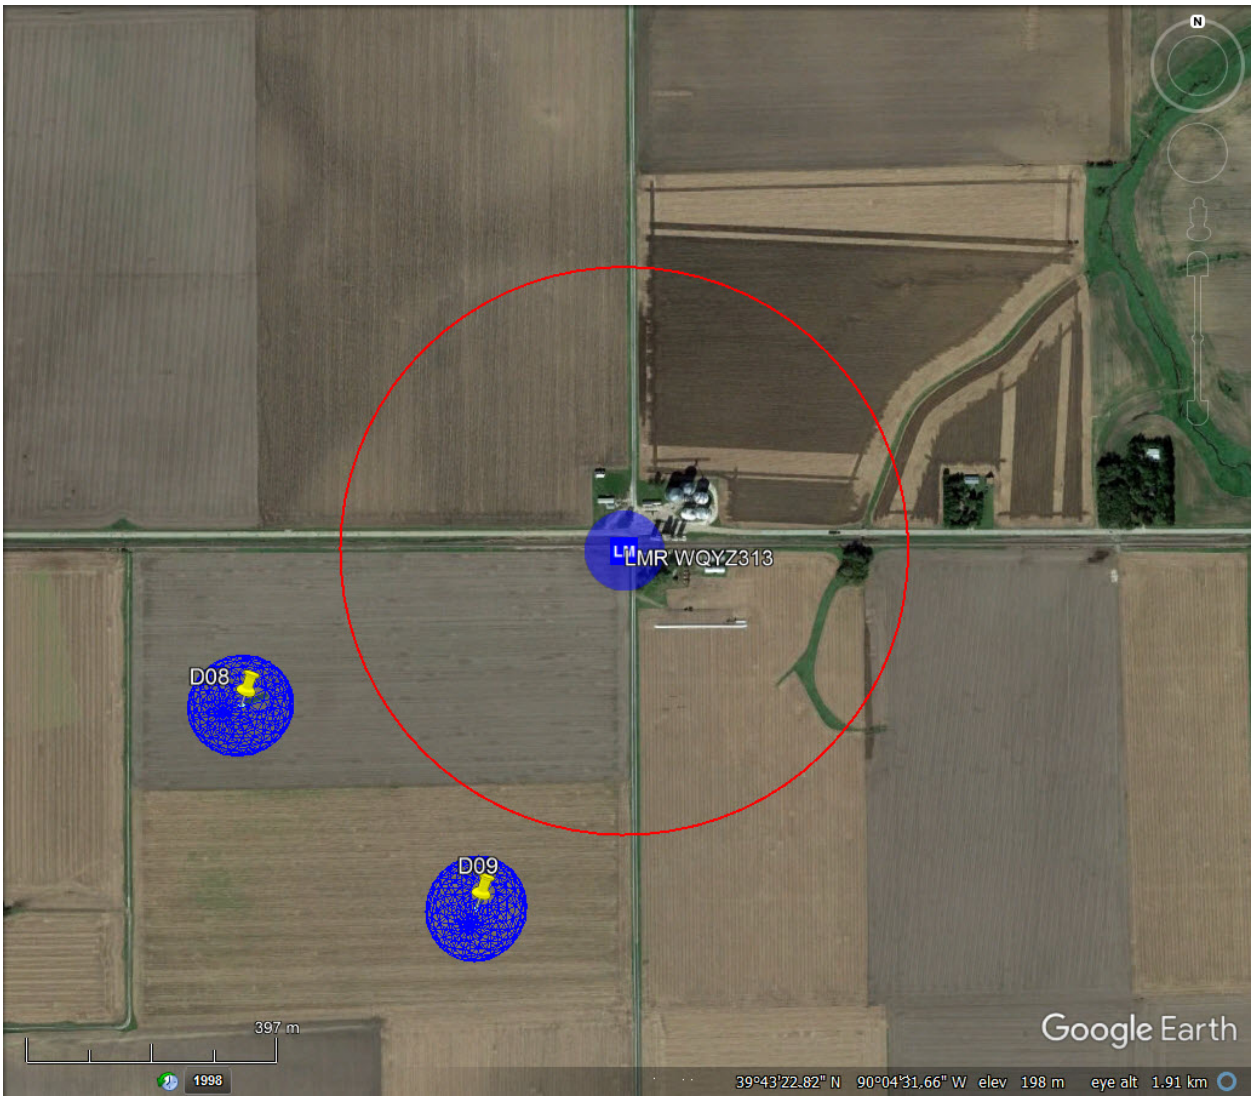

Figure 2 – Land Mobile Station WQYZ313-Location 4 near Lincoln Land Turbines (450-meter radius circle around station)

As can be seen in the above image, the distances from planned Turbines D08 and D09 to the land mobile station exceed the recommended spacing of 450 meters.

III. ANALYSIS OF TV BROADCAST FACILITIES

The rotating blades of a wind turbine have the potential to disrupt over-the-air broadcast TV reception within a kilometer or more of the turbine, especially when the direct path from the TV tower to the viewer's residence is obstructed by terrain. Interference is caused when signals reflected by the blades arrive at the viewer's TV antenna along with the direct signal. This is known as "multipath interference." However, as turbine manufacturers have replaced all-metal blades with blades constructed of mostly nonmetallic materials[4], this effect has been reduced. Also, the new generation of HDTV receivers is better equipped to deal with minor multipath interference (which is manifested by "pixilating" or "freezing" of the digital picture) than analog TV sets, as special circuitry is employed to suppress the weaker reflected signal. Occasionally, however, multipath interference from one or more turbines can cause video failure in HDTV receivers, especially if the receiver location is in a valley or other place of low elevation.

There is some possibility of signal disruption for residences that have to point their outdoor antennas through the turbine area, or that utilize "rabbit ear" antennas and/or older HDTV receivers. This typically occurs when the HDTV receiver location is significantly below grade level at the turbine base, but because the terrain in and around the Lincoln Land project area is fairly level, most of this effect should be dissipated for locations more than 1000 meters from a turbine. Usually, a rule of thumb is that up to 10% of the receiver locations potential are affected to some extent within the project footprint. The usual effect is intermittent "pixilation" or freezing of the digital TV picture. This estimate is based upon Evans Engineering's experience with similar wind energy projects.

Morgan County and the county to the east, Sangamon, are in the Champaign & Springfield-Decatur Designated TV Market Area (DMA) as defined by Nielsen Media Research. The TV stations that have been determined to place a predicted FCC primary off-the-air service signal over at least a portion of the project area or within one and one-half (1 ½) miles of the footprint of the wind project are listed in Table 2. The TV predicted service area boundaries of the stations listed in Table 2, and also those of more distant stations that don't reach within 1 ½ miles of the project footprint (listed separately in Table 3) are mapped in Figure 3.

[4] Modern turbine blades are usually constructed from glass-reinforced plastic (GRP), although they usually contain some metal for strengthening, balance and grounding.

Call Sign	Type of Station[5]	Network Affiliate	Displayed Channel	RF Channel	City of License	Power (KW)	Ant. Height (m HAAT)	Dist. km)	Azimuth (°T)

* FCC Construction Permits for the specified facilities.

Table 2 - TV Stations Serving Lincoln Land Project Area and Environs

The above stations are predicted to place a predicted FCC primary off-the-air service signal over at least a portion of the project area or within one and one-half (1 ½) miles of the footprint of the wind project. The predicted service areas of these stations are shown in yellow in Figure 3.

Many of the TV stations listed in this report were due to change to new RF channels due to an FCC nationwide initiative to vacate the upper UHF TV band that has recently been repurposed for future wireless and LTE mobile services. These new channel assignments may involve changes in station operating parameters (such as power and antenna elevation adjustments), or in a few cases, relocation to another transmitter tower. TV stations in Illinois had until January 17, 2020 to begin operating on their new channel assignments. The determinations in this report assume that all stations affected by the TV band "re-packing" are operating as per their FCC "re-packing" construction permits.

Six of the 11 high-power (conventional) stations from the Champaign & Springfield-Decatur TV market are predicted to serve all or part of the Lincoln Land area with a satisfactory over-the-air

[5] "Conventional" TV station is a station serving a wide geographic area which is often affiliate of a major broadcast network but also could be independent of a network; "Translator" is a low-power station that rebroadcasts the programming of a conventional station; "Low Power" TV station is a community-based station that serves a small area.

signal. Two high-power stations in the Quincy, IL-Hannibal, MO-Keokuk, IA market, WGEM-TV and KHQA-TV, are also predicted to service the project vicinity.

If the Lincoln Land wind project should cause disruptions to over-the-air TV viewing, methods to resolve them are available, and are as follows:

1. Relocation of the household antenna to receive a better signal
2. Installation of a better outside antenna, or one with a higher gain
3. Installation of satellite or cable TV

According to this engineer's calculations, there are 1,170 households within an area likely to be affected (approximately 184 square miles). It is conservatively estimated that 55%, or 644 of the households receive TV programming primarily by satellite dish or cable. This leaves an estimated 526 households relying on transmitted off-the-air TV signals. Based on the 10% criteria described previously, up to 53 TV receiving locations may be affected to varying degrees in the very worst-case. Mitigation costs would be approximately $200 per location for an upgraded outdoor antenna, or $480 per year per location for a basic satellite or cable subscription.

It is the opinion of this consultant that any disruptions to over-the-air TV broadcast signals, if they occur, can be resolved satisfactorily.

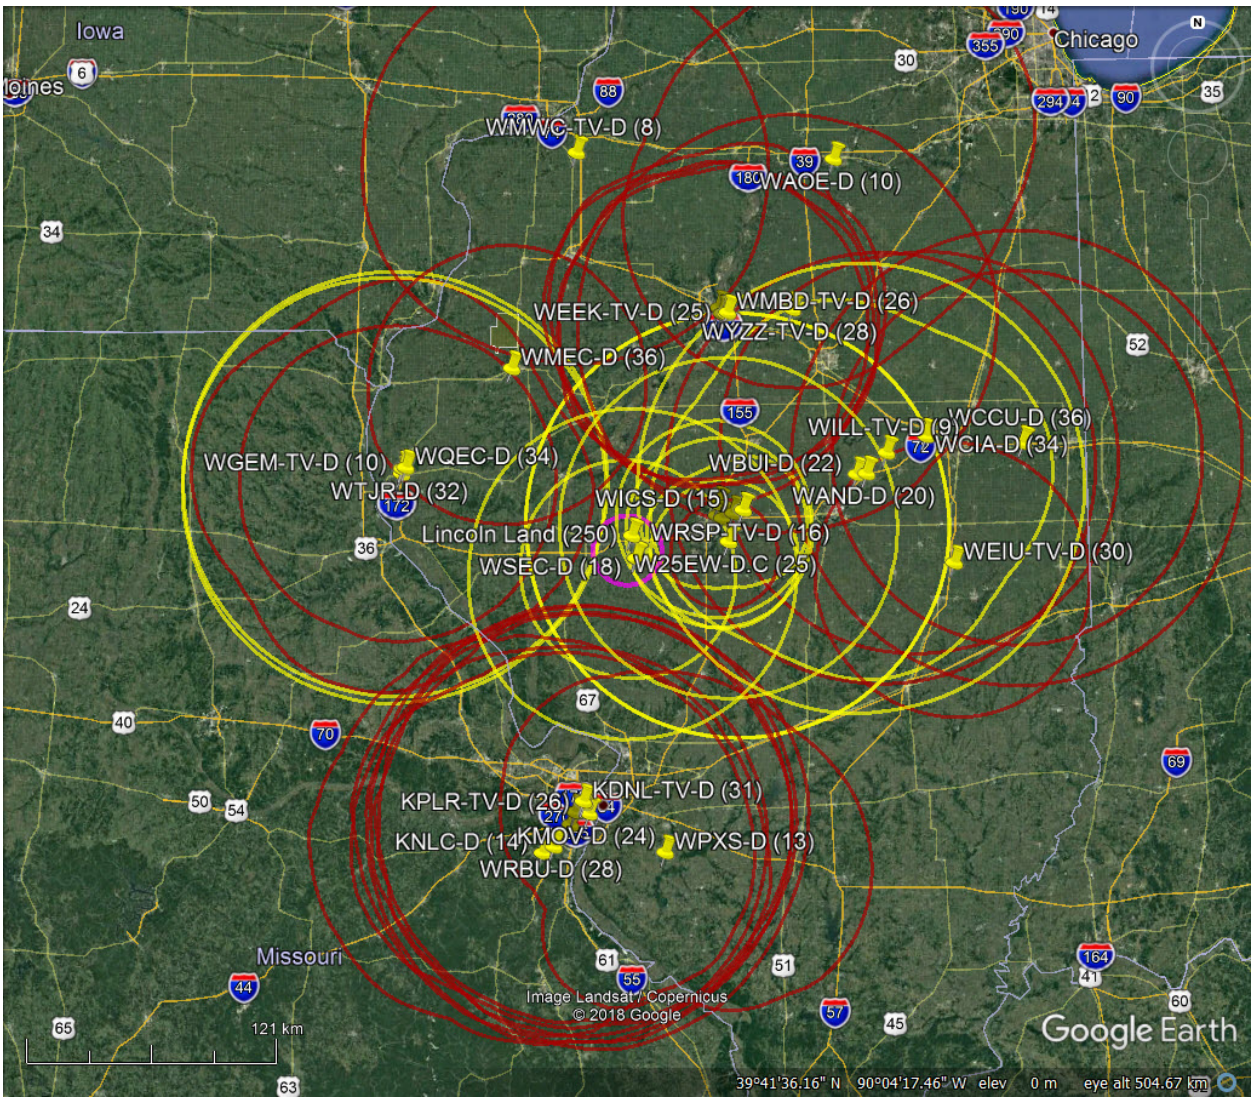

Figure 3 – Predicted Over-the-Air Television Coverage into Lincoln Land Project Area

The yellow boundaries represent TV station coverages that extend into the Lincoln Land wind energy project area. Eleven TV stations, including low power and translator stations, are predicted to reach the project area. The dark red boundaries represent the predicted TV coverages of distant stations, such as in the St. Louis market to the south and in the Peoria market to the north, that do not reach within 1 ½ miles of the project footprint.

The more distant TV stations whose predicted coverages are 1 ½ miles or more beyond the Lincoln Land project footprint are listed below in Table 3. Their predicted service areas are shown in dark red in Figure 3.

Table 3 - TV Stations Serving Areas beyond the Lincoln Land Project Area

IV. NTIA NOTIFICATION

Operation of RF frequencies for federal government use is managed by the National Telecommunication Information Agency (NTIA), which is part of the U.S. Department of Commerce. The technical specifications for most government facilities are unavailable to the public. In order to avoid the derailment of the wind energy project due to late objections from a government agency, the NTIA should be notified of the proposed project during pre-construction planning. The NTIA has set in place a review process, wherein the Interdepartmental Radio Advisory Committee (IRAC), consisting of representatives from various government agencies, reviews new proposals for wind turbine projects for impact on government frequencies. In almost all cases, no adverse impact is found, and IRAC usually issues a determination in about 60 days.

On November 18, 2019, this office sent a notification of the Lincoln Land wind project to the NTIA. The NTIA responded with a determination letter dated January 24, 2020, stating that no federal agencies had concerns of harmful interference caused by the turbines.

V. CONCLUSIONS AND RECOMMENDATIONS

1. No FCC-licensed land mobile or public safety transmitting stations are expected to be adversely affected, assuming that their transmitting sites are located as per the antenna location descriptions in the FCC licenses.

2. Over-the-air TV interference due to operating wind turbines may occur but is not expected to be a significant or intractable problem due to the mitigation options available. Effective mitigation methods to resolve any interference that may occur include satellite or cable service installation which provides the worst-case solution. The Applicant or Operator of the Lincoln Land wind energy project will take commercially reasonable steps to respond to a complaint regarding over-the-air TV interference due to operation of the wind project as required in the Morgan County ordinance.

Respectfully Submitted,

B. Benjamin Evans
RF Impact Consultant

Attention: Will Nissen – Development Manager

Subject: Market Impact Analysis
Lincoln Land Wind
Morgan County, Illinois

Dear Mr. Nissen,

In accordance with your request, the proposed development of the Lincoln Land Wind in Morgan County, Illinois, has been analyzed and this market impact analysis has been prepared.

MaRous & Company has conducted similar market impact studies for a variety of clients and for a number of different proposed developments over the last 39 years. Clients have ranged from municipalities, counties, and school districts, to corporations, developers, and citizen's groups. The types of proposals analyzed include: commercial developments such as shopping centers and big-box retail facilities; religious facilities such as mosques and mega-churches; residential developments such as high-density multifamily and congregate-care buildings and large single-family subdivisions; recreational uses such as skate parks and lighted high school athletic fields; and industrial uses such as waste transfer stations, landfills, and quarries.

MaRous & Company has conducted numerous market studies of energy-related projects. The wind-related projects include the following by state:

- **Illinois** - Grand Ridge V and Otter Creek wind farms in LaSalle County, Pleasant Ridge Wind Farm in Livingston County, Walnut Ridge Wind Farm in Bureau County, McLean County Wind Farm in McLean County, Radford's Run Wind Farm in Macon County, Midland Wind Project in Henry County, Harvest Ridge Wind Project in Douglas County, and Lincoln Land Wind in Morgan County;
- **Indiana** - Tippecanoe County Wind Farm in Tippecanoe County and Roaming Bison Wind Farm in Montgomery County;
- **Iowa** - Ida County and Palo Alto County Wind Farms;
- **Minnesota** - Freeborn County Wind Farm in Freeborn County;
- **South Dakota** - Dakota Range Wind Project I, II, & III, in Codington County, Grant County, and Roberts County, Deuel Harvest Wind Farm in Deuel County, Crocker Wind Farm in Clark County, Prevailing Wind Park in Charles Mix County, Bon Homme County, and Hutchinson County, Triple-H Wind Project in Hyde County, Tatanka Ridge Wind Farm in Deuel County, and Sweetland Wind Farm in Hand County;
- **Kansas** - Neosho Ridge Wind Farm in Neosho County;
- **New York** - Orangeville Wind Farm in Wyoming County;
- **Ohio** - Seneca Wind in Seneca County and Republic Wind in Seneca County and Sandusky County.

The solar-related projects include the following by state:

- **Illinois** - Hickory Point Solar Energy Center in Christian County
- **Indiana** - Lone Oak Solar Farm in Madison County;
- **Wisconsin** - Badger Hollow Solar Farm in Iowa County;
- **Maryland** - Dorchester County Solar Farms in Dorchester County; and
- **Solar Projects of the Western Regions of the United States of America -** Arizona, Colorado, Nevada, New Mexico, and Utah in the Southwest Region; Idaho and Oregon in the Northwest Region; Texas in the Southern Great Plains Region; General Research in the Northern Great Plains Region.

We also have analyzed the impact of transmission lines on adjacent residential uses and a number of proposed natural gas-fired electric plants in various locations.

Project Summary

Project Information	
Project Name	Lincoln Land Wind, LLC
Location	Morgan County, Illinois
Property Type	Wind Farm
Project Developer	Apex Clean Energy, Inc.
Wind Farm Description	
Footprint Land Acreage	≈36,000 Acres
Actual Land Acreage Used by Turbines	Up to 55 Acres
Number of Turbines	Up to 107 Turbines
Turbine Specifications	
Type	General Electric – GE127, GE140 Nordex – N149 Vestas – V150
Capacity	2.8-4.8 Megawatts
Tip Height	551-598.6 Feet
Total Capacity	Up to 303.6 Megawatts
Setbacks/Noise	**Setbacks:** ⁘ 1,650 feet from non-participating primary structures, unless a written waiver is obtained from the adjacent landowner ⁘ 1,320 feet from participating primary structures, unless a written waiver is obtained from the adjacent landowner ⁘ 600 feet maximum turbine height **Noise:** ⁘ IPCB sound restrictions will be met
Number of Participants	≈228 Landowners
Participant Acreage	≈35,000 Acres
Ancillary Construction	
Project substation	Operations and maintenance building
Underground collector lines	Fiber optic cable and junction boxes
Meteorological towers	Gravel access roads
Aircraft detection lighting system (ADLS)	
Total Cost	≈$400,000,000

Purpose and Intended Use of the Study

The purpose of this appraisal assignment is to analyze the impact, if any, on the value of the surrounding rural residential and agricultural properties due to the development of the wind farm. Specifically, this study is designed to address the question of whether the development of the wind farm has an effect on the value of residential uses and/or agricultural land in proximity to the turbines. Any other use or user of this report is considered to be unintended.

Executive Summary

As a result of the market impact analysis undertaken, I concluded that there is no market data indicating the project will have a negative impact on either rural residential or agricultural property values in the surrounding area. Further, market data from Illinois supports the conclusion that the project will not have a negative impact on rural residential or agricultural property values in the surrounding area. Finally, for agricultural properties that host turbines, the additional income from the wind lease may increase the value and marketability of those properties. The foregoing general conclusions are the result of considerable study of the following information and data:

- The use will meet or exceed all the required development and operating standards;
- Controls are in place to ensure on-going compliance;
- There are significant financial benefits to the local economy and to the local taxing bodies from the development of the wind farm;
- The wind farm will create well-paid jobs in the area which will benefit overall market demand;
- An analysis of recent residential sales proximate to existing wind farms, which includes residential sales within five times turbine tip height, did not support any finding that proximity to a wind turbine had any impact on property values;
- An analysis of agricultural land values in the area and in other areas of the state with wind farms did not support any findings that the agricultural land values are negatively impacted by the proximity to wind turbines;
- Studies indicate that wind turbine leases add value to agricultural land;
- A survey of County Assessors in 18 Illinois counties in which wind farms are located determined that there was no market evidence to support a negative impact upon residential property values as a result of the development of and the proximity to a wind farm and that there were no reductions in assessed valuations;
- A survey of County Assessors in 5 Indiana counties in which wind farms are located determined that there was no market evidence to support a negative impact upon residential property values as a result of the development of and the proximity to a wind farm, and that there were no reductions in assessed valuations;

- A survey of County Assessors in 21 Kansas counties in which wind farms are located determined that there was no market evidence to support a negative impact upon residential property values as a result of the development of and the proximity to a wind farm and that there were no reductions in assessed valuations;
- A survey of County Assessors in 8 South Dakota counties in which wind farms are located determined that there was no market evidence to support a negative impact upon residential property values as a result of the development of and the proximity to a wind farm and that there were no reductions in assessed valuations;
- A survey of County Assessors in 26 Iowa counties in which wind farms are located determined that there was no market evidence to support a negative impact upon residential property values as a result of the development of and the proximity to a wind farm and that there were no reductions in assessed valuations;
- A survey of County Assessors in 8 Minnesota counties in which wind farms are located determined that there was no market evidence to support a negative impact upon residential property values as a result of the development of and the proximity to a wind farm and that there were no reductions in assessed valuations;
- A survey of County Assessors in 3 Ohio counties in which wind farms are located determined that there was no market evidence to support a negative impact upon residential property values as a result of the development of and the proximity to a wind farm and that there were no reductions in assessed valuations; and
- A summary of the findings in literature on peer-reviewed studies of wind farms in North America, although not specific to Illinois, reported conclusions that are consistent with our findings.

Definition of Market Value

When discussing market value, the following definition is used:

The most probable price a property should bring in a competitive and open market under all conditions' requisite to a fair sale, the buyer and seller each acting prudently and knowledgeably, and assuming the price is not affected by undue stimulus. Implicit in this definition is the consummation of a sale as of a specified date and the passing of title from seller to buyer under conditions whereby:

- Buyer and seller are typically motivated;
- Both parties are well informed or well advised, and acting in what they consider their own best interests;
- A reasonable time is allowed for exposure in the open market;
- Payment is made in terms of cash in U.S. dollars or in terms of financial arrangements comparable thereto; and
- The price represents the normal consideration for the property sold unaffected by special or creative financing or sales concessions granted by anyone associated with the sale.[1]

Scope of Work and Reporting Process

Information was gathered concerning the real estate market generally and the market of the area surrounding the proposed wind farm specifically. The uses in the surrounding area were considered. The following summarizes the actions taken:

- Review and analysis of the Morgan County Wind Energy Ordinance, and other public documents;
- Review and analysis of the demographics in the area of the proposed wind farm;
- Review and analysis of data on the general market area of the wind farm, and on the other areas in Illinois and/or Morgan County in which existing wind farms are located;
- Review and analysis of data on the market for single-family houses in the immediate area of the proposed wind farm and from other areas in each of the counties from public sources, and from the Morgan County and/or Illinois public records;
- Interviews of local real estate professionals concerning recent sales in the area, local market conditions, and the impact of wind turbines on property values in the area;
- Properties used for development of the matched pairs were physically inspected on the exterior, and photographs of the interiors were reviewed where available;
- Inspections were performed of the project area and the areas in nearby counties with existing wind farms by Michael S. MaRous on July 15, 2019.

[1] *(12 C.F.R. Part 34.42(g); 55 Federal Register 34696, August 24, 1990, as amended at 57 Federal Register 12202, April 9, 1992; 59 Federal Register 29499, June 7, 1994)*

This document is considered to conform to the requirements of the *Uniform Standards of Professional Appraisal Practice and Advisory Opinions* (USPAP). This letter is a brief recapitulation of the appraisal data, analyses, and conclusions. Additional supporting documentation is retained in the MaRous and Company office file. There are no extraordinary assumptions or hypothetical conditions included in the market study.

In order to form a judgment concerning the potential impact, if any, on the value of the surrounding residential properties of the approval of the conditional use for the wind farm, I have considered the following:

- The character and the value of the residential and agricultural properties in the general area of the proposed wind farm;
- Agricultural land values in Morgan County, and in other Illinois counties in which wind farms are located;
- Market trends for both residential and agricultural land up to the past 5 years;
- The economic impact the proposed wind farm would have on the larger community; and
- The potential impact on the value of the surrounding residential and agricultural properties.

Other Existing Wind Farms Near the Project Area

The closest wind farm is the HillTopper Wind Farm located in southeast in Logan County, the project consists of 74 wind turbines and came online in 2018. Radford's Run Wind Farm is in southeast in Macon County, the project consists of 139 wind turbines and came online in late 2017. Rail Splitter Wind Farm is located in northern Logan County and southern Tazewell County. The 67-turbine wind farm came online in July 2009. Twin Groves Wind Farm is located to the northeast in McLean County, consists of 240 wind turbines, and came online in 2008. California Ridge Wind Farm is located to the east in Champaign and Vermilion counties. This project consists of 134 wind turbines and came online in 2012.

Residential Sales Nearest to the Project Area

Like the majority of Illinois, this area is primarily rural in nature. In addition to farms, there are single-family houses situated on either smaller lots or larger farmsteads. The following table summarizes examples of the most recent single-family residential sales in the general area of the Lincoln Land Wind. A map illustrating the location of each of these sales is included in the addenda to this market impact study.

MOST RECENT SINGLE-FAMILY RESIDENTIAL SALES SUMMARY IN THE AREA NEAREST TO THE LINCOLN LAND WIND

No.	Location	Sale Price	Sale Date	Site Size (Acres)	Year Built	Building Size (Sq. Ft.)	Sale Price Per Sq. Ft. of Bldg. Area Incl. Land
1	935 Wood Rd. Jacksonville, Illinois	$68,000	5/14/18	1.46	1940	1,120	$60.71
2	787 Rees Station Rd. Franklin, Illinois	$105,000	5/15/18	1.00	1915	1,402	$74.89
3	105 Spradlin Ave. Alexander, Illinois	$110,000	4/22/19	0.29	1982	1,674	$65.71
4	3103 Hermes Rd. Alexander, Illinois	$135,000	9/18/18	1.00	1955	2,174	$62.10
5	3339 Brown Rd. New Berlin, Illinois	$252,500	11/22/17	2.00	2002	3,200	$78.91

Project Description

The project is proposed to consist of up to 107 turbines with an individual capacity of 2.8 up to 4.8 megawatts; the turbines have a tip height of up to 598.6 feet. The total capacity of the wind farm will be approximately 303.6 megawatts, with a total footprint covering approximately 36,000 acres.

The turbines will be constructed to meet applicable standards and will be monitored to ensure compliance with those standards and to limit the impact of noise, and shadow flicker. The wind ordinance put in place requires the use of the Aircraft Detection Lighting System, or ADLS, for all turbines to be installed. Additional efforts are being made to limit the impact on avian and wildlife resources in the area.

Roads will be improved both before and after construction to accommodate the installation of the turbines and to repair any damage caused by the construction. Decommissioning Phase road repairs will be undertaken.

The total project cost will be approximately $400,000,000. Ancillary construction includes gravel access roads, underground collector lines, a project substation, an operations and maintenance building, and fiber optic cable and junction boxes.

Project Benefits

Taxes	
Total Revenue	Estimated total to be greater than $65,600,000 over the life of the project
Beneficiary Totals over the Life of the Project	Morgan County ≈ $9,800,000; School Districts ≈ $43,800,000; Road District ≈ $5,500,000
Land Agreements	
Participating Landowner Lease Payments	Participating landowner payments will consist of approximately $90,000,000 over the first 30 years of the project
Job Creation	
Temporary/Construction	≈395 Construction Jobs
Permanent	≈39 Permanent Jobs
Induced Impacts due to Construction	
Indirect Impacts	Permit payments to the county and anticipated increase in household spending to local businesses

Market Impact Analysis

A market impact analysis is undertaken to develop an opinion as to whether the proposed wind farm will have an effect on the value of residential uses and/or agricultural land in proximity to the turbines. This analysis includes:

- A matched pair analysis considering the impact on value of residential properties proximate to a wind farm in Illinois, as well as matched pairs developed and analyzed of residential properties in counties with similar demographics, land use, and economic characteristics of other states in the Midwest, specifically, Indiana, Kansas, South Dakota, Minnesota, and Iowa;
- The value of agricultural land in Morgan County and in other counties with existing wind farms;
- Interviews of local and national real estate professionals;
- The results of a survey of assessors in Illinois, Indiana, Kansas, South Dakota, Minnesota, and Iowa with existing wind farms in their respective jurisdictions; and
- The results of several academic and peer-reviewed studies on the impact of wind turbines on residential property values.

Matched Pair Analysis

A matched pair analysis is a methodology which analyzes the importance of a selected characteristic, in this instance proximity to a wind turbine, to the value of a property.[2] This technique compares the sale of a property in proximity to the selected characteristic to the sale of a similar property in the same market area and under similar market conditions but without the proximity to the selected characteristic.

It is difficult to find properties that are identical except for proximity to a wind turbine, and which also occurred under substantially similar market conditions, especially in rural areas. Many sales in the area are also conducted privately from family member to family member, or passed down from generation to generation, causing there to be a lack of sale information. Additionally, in many cases, the properties in these types of transactions do not sell at full value. The matched pair analysis accounts for different adjustments that must be made to account for the differences in the paired properties.

Data from similar Midwestern states that have a strong presence of wind turbines, similar demographics, similar economics, and similar agricultural characteristics, have also been analyzed.

Details of the sales included in this analysis are retained in my office files; maps in the addenda to this report illustrate the location of the properties. Unless otherwise indicated, none of the purchasers in these transactions appear to own any other property in proximity, and none of the transactions appear to have a wind turbine lease associated with the property.

Illinois Analysis - Macon County Matched Pair No. 1

Macon County Matched Pair #1 considers the recent sale of a property located at 8873 North Glasgow Road, Warrensburg, that is 1,855 feet from the nearest wind turbine located within the subject, Radford's Run, with approximately four additional turbines visible from the property to the north and west.

This sale is compared with a similar property located at 1511 Hunters View Drive, Mount Zion, that sold in June 2013. The location is in a suburban setting, but the area is still very rural in nature. The salient details of these two properties are summarized in the table below.

MACON COUNTY MATCHED PAIR NO. 1

	1A - Proximate to a Wind Turbine	1A - Prior Sale	1B - Not Proximate to a Wind Turbine
Address	8873 North Glasgow Rd. Warrensburg, IL 62573	8873 North Glasgow Rd. Warrensburg, IL 62573	1511 Hunters View Dr. Mount Zion, IL 62549
Distance from Turbine	1,855 Feet	NA	NA
Sale Date	June 12, 2017	March 25, 2014	June 31, 2013
Sale Price	$214,000	$184,000	$193,000
Sale Price/Sq. Ft. (A.G.)	$124.35	$106.91	$91.90
Year Built	2006	2006	2006
Building Size (Sq. Ft.)	1,721	1,721	2,100

Utilities	Geothermal heat & cooling; Well & septic	Geothermal heat & cooling; Well & septic	Central Air; Forced-air heat; Public Sewer
Other	2.5-car attached garage; front porch and deck	2.5-car attached garage; front porch	3-car attached garage; patio

8873 North Glasgow Road

1511 Hunters View Drive

The house at 8873 North Glasgow Road, is located approximately 8 miles northwest of Decatur, in a rural area. According to the Macon County Assessor's records, this house previously sold in March 2014 for $184,000. This indicates an increase in value of approximately 16% during a period in which residential sale prices generally were not increasing. There is no lease for a wind turbine on this property. According to the most recent selling broker, there was an issue with the well test; the yard was dug up to find the well and to treat the problem. The yard has since returned to normal condition. The broker also stated that the house is in excellent condition and showed very well. The sellers added a wrap-around deck and finished part of the basement to add a fourth bedroom. The seller was being relocated and was offered a low price for the relocation fee; the sellers put the house on the market on their own and were able to sell it within six weeks, for greater than the asking price.

The house on Hunters View Drive has a similar, rural location, yet is situated in a suburban setting, and is approximately 4 miles south of Decatur. Although this house sits on a smaller lot than the Glasgow Road property, this is offset by the extra bedroom and by the second floor. The property is not near a wind farm.

ADJUSTMENT GRID MATCHED PAIR NO. 1

SALE NO.	ADDRESS	SALE DATE	YEAR BUILT	BUILDING SIZE	LOT SIZE	LOCATION	STYLE	BASEMENT	UTILITIES	OUT-BUILDINGS
1B	1511 Hunters View Drive Mount Zion, Illinois	+	O	-	+	-	O	O	+	O

\+ Positive adjustment based on comparable being inferior in comparison to property #1A
\- Negative adjustment based on comparable being superior in comparison to property #1A
O No adjustment necessary

The comparison will be made to the June 2017 date of sale because it is most similar to the sale of the Hunters View Drive property.

Upward adjustments are made for the superior market conditions, larger lot size, and geothermal heating and cooling system of the Glasgow Road property. Downward adjustments are made for the superior building size of the Hunters View Drive property. When the adjustments noted above are made to the sale price of the Hunters View Drive property, the two properties have essentially the same sale price per square foot value. Therefore, although the Hunters View Drive house is larger, the higher per foot sales price for the Glasgow Road house is justified by its superior condition and amenities, and its larger lot size. Thus, the difference in the sales price does not support the conclusion that there is any diminution in value resulting from the proximity of the Glasgow Road property to wind turbines. This is further supported by the subsequent sale of the Glasgow Road property, at which time the 2017 sale price increased by $17.44 per square foot over the 2014 sale price.

Illinois Analysis - McLean County Matched Pair No. 1

McLean County Matched Pair No. 1 considers the sale of a house located at 29394 E 850 North Road, Ellsworth, that sold in November 2015 for $207,000. This house is located approximately 1,865 feet from the nearest turbine, and there are several turbines visible to the north and east. The photograph below is of the turbines visible from the house, with the majority visible in the distance.

This property is compared with a similar property located at 26298 E 1000 North Road, Downs, that sold in March 2015 for $220,000. This property is not located near wind turbines; however, there are some visible more than 1 mile to the east. Market conditions are considered to be similar. Both properties are situated in rural locations. The salient details of these two properties are summarized in the following table.

MCLEAN COUNTY MATCHED PAIR NO. 1		
	1A - Proximate to a Wind Turbine	**1B - Not Proximate to a Wind Turbine**
Address	29394 E 850 North Rd. Ellsworth, IL 61737	26298 E 1000 North Rd. Downs, IL 61736
Distance from Turbine	1,865 Feet	N/A
Sale Date	November 17, 2015	March 11, 2015
Sale Price	$207,000	$220,000
Sale Price/Sq. Ft. (A.G.)	$86.25	$82.71
Year Built	1978	1978
Building Size (Sq. Ft.)	2,400	2,660
Lot Size (Acres)	1.70	2.49
Style	Two-story, frame (vinyl/brick) 4 bedrooms; 2 bath	Two-story, frame (vinyl) 4 bedrooms; 2 bath
Basement	Full, finished	Full, finished
Utilities	Central air; Propane heat; Well & septic	Central air; Propane heat; Well & septic
Other	2-car detached garage; patio, deck, small shed	2.5-car attached garage; large storage shed

29394 E 850 North Road

26298 E 1000 North Rd.

Both houses are of similar construction type, vintage, and size. Both had been updated recently, with the house at 29394 E 850 North Road having been updated more extensively than the other. Both have finished basements; however, basement build-out in the house at 26298 E 1000 North Road is not completely finished. The house at 26298 E 1000 North Road has a large shed with a drive-in door. The superior interior features and the larger shed are offset by the approximately ½-acre larger site size of the property at 26298 E 1000 North Road. Both houses are located on paved roads.

ADJUSTMENT GRID MATCHED PAIR NO. 1

SALE NO.	ADDRESS	SALE DATE	YEAR BUILT	BUILDING SIZE	LOT SIZE	LOCATION	STYLE	BASEMENT	UTILITIES	OUT-BUILDINGS
1B	26298 E 1000 North Rd. Downs, Illinois	o	o	o	-	o	o	o	o	-

\+ Positive adjustment based on comparable being inferior in comparison to property #1A
\- Negative adjustment based on comparable being superior in comparison to property #1A
o No adjustment necessary

Downward adjustments are made for the superior lot size and outbuildings of the 26298 E 1000 North Road property. When the adjustments noted above are made to the sale price of the 26298 E 1000 North Road property, the two properties have essentially the same sale price per square foot value. Thus, the difference in the sales price does not support the conclusion that there is any negative impact on value resulting from the proximity of the 29394 E 850 North Road property to wind turbines.

Illinois Analysis - McLean County Matched Pair No. 2

McLean County Matched Pair No. 2 considers the sale of a house located at 25156 E 1400 North Road, Ellsworth, that sold in November 2015 for $196,000. This house is located approximately 2,210 feet from the nearest turbine, but there are several turbines proximate to the south, southeast, and southwest. The photograph below is of the turbines visible from the property.

This property is compared with a similar property located at 787 E 1300 North Road, Sibley, that sold in March 2015 for $125,000. This property is not located near wind turbines. Market conditions are considered to be similar. Although this property is located in Ford County, both properties have similar, rural locations. The salient details of these two properties are summarized in the following table.

MCLEAN COUNTY MATCHED PAIR NO. 2		
	2A - Proximate to a Wind Turbine	**2B - Not Proximate to a Wind Turbine**
Address	25156 E 1400 North Rd. Ellsworth, IL 61737	787 E 1300 North Rd. Sibley, IL 61773
Distance from Turbine	2,210 Feet	N/A
Sale Date	November 1, 2015	March 13, 2015
Sale Price	$196,000	$125,000
Sale Price/Sq. Ft. (A.G.)	$66.58	$49.56
Year Built	1890	1900
Building Size (Sq. Ft.)	2,944	2,522
Lot Size (Acres)	4.14	3.36
Style	Two-story, frame (vinyl) 4 bedrooms; 2 bath	Two-story, frame (vinyl) 4 bedrooms; 2 bath
Basement	Full, finished	Full, partially finished
Utilities	Central air; Propane heat; Well & septic	Central air; Propane heat; Well & septic
Other	1-car attached garage; porch; machine shop	2-car detached garage; deck, large shed

25156 E 1400 North Road

787 E 1300 North Road

Both houses are of similar construction type, vintage, and size. Both have been remodeled in the recent past. The E 1400 North Road house has a large freestanding garage/machine shed that has water and electricity, which is superior to the older shed on the site of the E 1300 North Road house. Also, the site size of the E 1400 North Road house is approximately ¾ acre larger than the E 1300 North Road house. Both factors are reflected in its higher sale price.

ADJUSTMENT GRID MATCHED PAIR NO. 2

SALE NO.	ADDRESS	SALE DATE	YEAR BUILT	BUILDING SIZE	LOT SIZE	LOCATION	STYLE	BASEMENT	UTILITIES	OUT-BUILDINGS
2B	787 E 1300 North Rd. Sibley, Illinois	O	O	+	+	O	O	O	O	O

\+ Positive adjustment based on comparable being inferior in comparison to property #2A
\- Negative adjustment based on comparable being superior in comparison to property #2A
O No adjustment necessary

Upward adjustments are made for the larger building size and the larger lot size of the E 1400 North Road property. When the adjustments noted above are made to the sale price of the E 1300 North Road property, the two properties have a similar sale price per square foot value. Thus, the difference in the sales price does not support the conclusion that there is any negative impact on value resulting from the proximity of the E 1400 North Road property to wind turbines.

Illinois Analysis - McLean County Matched Pair No. 3

McLean County Matched Pair No. 3 considers the sale of a house located at 25017 E 1400 North Road, Ellsworth, that sold in September 2015 for $159,000. This house is located approximately 1,573 feet from the nearest turbine, and there are several turbines proximate to the south, southeast, and southwest. The photograph below is of the turbines visible from the property.

This property is compared with a similar property located at 10837 Yankee Town Road, Farmer City, that sold in October 2016 for $134,000. This property is not located near wind turbines. Market conditions are considered to be slightly superior at the date of sale of this property. Although this house is located in DeWitt County, both properties have similar rural locations. The salient details of these two properties are summarized in the following table.

MCLEAN COUNTY MATCHED PAIR NO. 3		
	3A - Proximate to a Wind Turbine	**3B - Not Proximate to a Wind Turbine**
Address	25017 E 1400 North Rd. Ellsworth, IL 61737	10837 Yankee Town Rd. Farmer City, IL 61842
Distance from Turbine	1,573 Feet	N/A
Sale Date	September 3, 2015	October 3, 2016
Sale Price	$159,000	$134,000
Sale Price/Sq. Ft. (A.G.)	$81.45	$68.37
Year Built	1880	1908
Building Size (Sq. Ft.)	1,952	1,960
Lot Size (Acres)	2.87	4.00
Style	Two-story, frame (vinyl) 4 bedrooms; 2 bath	Two-story, frame (vinyl) 4 bedrooms; 2 bath
Basement	Full, finished	Full, finished
Utilities	Central air; Propane heat; Well & septic	Central air; Propane heat; Well & septic
Other	No separate garage; large shed with drive-in doors; other farm buildings	No separate garage; large shed with drive-in doors; other farm buildings

25017 E 1400 North Road

10837 Yankee Town Road

Both houses are of similar construction type, vintage, and size. Both have been remodeled and updated. Neither property has a garage; both have large buildings with drive-in doors for cars and other equipment. Both properties have other farm buildings on the site. The Yankee Town Road house has a site that is approximately 1.25 acres larger than that of the E 1400 North Road house.

ADJUSTMENT GRID MATCHED PAIR NO. 3

SALE NO.	ADDRESS	SALE DATE	YEAR BUILT	BUILDING SIZE	LOT SIZE	LOCATION	STYLE	BASEMENT	UTILITIES	OUT-BUILDINGS
3B	10837 Yankee Town Rd. Farmer City, Illinois	-	o	o	-	o	o	o	o	o

\+ Positive adjustment based on comparable being inferior in comparison to property #3A
\- Negative adjustment based on comparable being superior in comparison to property #3A
o No adjustment necessary

Downward adjustments are made for the superior market conditions and larger lot size of the E 1400 North Road property. When the adjustments noted above are made to the sale price of the Yankee Town Road property, the E 1400 North Road property appears to have a superior sale price per square foot value to that of the Yankee Town Road property. Thus, the difference in the sales price does not support the conclusion that there is any negative impact on value resulting from the proximity of the E 1400 North Road property to wind turbines.

Illinois Analysis - Livingston County Matched Pair No. 1

Livingston County Matched Pair No. 1 considers the sale of a property in Livingston County that is located proximate to the Cayuga Ridge Wind Farm. Cayuga Ridge construction began in 2009, and the wind farm came fully online in March 2010. The house at 23090 N 2500 East Road, Odell, is 2,322 feet east of a wind turbine, 3,229 feet west of a wind turbine, and 3,440 feet south of a wind turbine. The photograph below illustrates the location of this house, on the right side of the frame, relative to the nearest turbines.

This sale is compared with a similar property located at 16101 E 1400 North Road in Pontiac that is not proximate to a wind turbine. The salient details of these two properties are summarized in the following table.

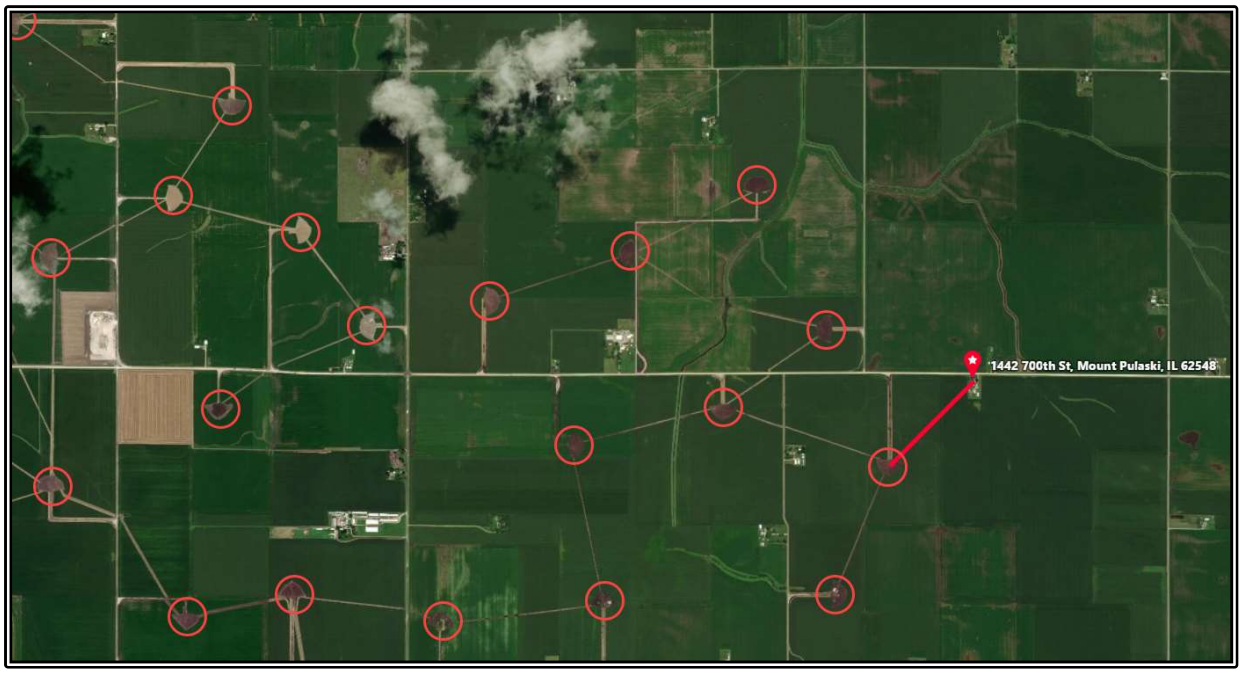
LIVINGSTON COUNTY MATCHED PAIR NO. 1		
	1A - Proximate to a Wind Turbine	**1B - Not Proximate to a Wind Turbine**
Address	23090 N 2500 East Rd. Odell, IL 60460	16101 E 1400 North Rd. Pontiac, IL 61764
Distance from Turbine	2,322 Feet	N/A
Sale Date	August 15, 2013	November 18, 2013
Sale Price	$205,000	$167,500
Sale Price/Sq. Ft. (A.G.)	$108.41	$89.33
Year Built	1971	1967
Building Size (Sq. Ft.)	1,891	1,875
Lot Size (Acres)	3.63	3.27
Style	One-story; brick 4 bedrooms, 1.1 bath	One-story; brick 3 bedrooms, 2 bath
Basement	Full, partially finished	Crawlspace
Utilities	Central air; Electric heat; Well & septic	Central air; Propane heat; Well & septic
Other	2-car detached garage; 2 pole barns; 60 x 90 shed (subsequently demolished)	1-car attached garage; 30 x 40 shed; 64 x 42 machine shop

23090 N 2500 East Road

16101 E 1400 North Road

Both properties are located in the Pontiac High School district. The lot sizes are similar; however, the Odell property is approximately ⅓-acre larger. The houses are of similar construction vintage and are of equivalent size. The condition of both is assumed to be similar. The Odell property has an additional bedroom and is superior in that it has a full, partially finished basement and a larger garage. However, the Pontiac property has two full bathrooms, a first-floor laundry room, and propane gas heat. The outbuildings of the Odell property were in poor condition and were demolished subsequent to the sale; therefore, the Pontiac property is considered superior in that regard, which offsets the smaller size of the garage.

ADJUSTMENT GRID MATCHED PAIR NO. 1



SALE NO.	ADDRESS	SALE DATE	YEAR BUILT	BUILDING SIZE	LOT SIZE	LOCATION	STYLE	BASEMENT	UTILITIES	OUT-BUILDINGS
1B	16101 E 1400 North Rd. Pontiac, Illinois	o	o	o	o	o	o	+	o	o
+	Positive adjustment based on comparable being inferior in comparison to property #1A									
-	Negative adjustment based on comparable being superior in comparison to property #1A									
o	No adjustment necessary									

An upward adjustment is made for the superior basement of the N 2500 East Road property. When the adjustments noted above are made to the sale price of the E 1400 North Road property, the N 2500 East Road property appears to have a superior sale price per square foot value to that of the E 1400 North Road property. Thus, the difference in the sales price does not support the conclusion that there is any negative impact on value resulting from the proximity of the N 2500 East Road property to wind turbines.

Illinois Analysis - Logan County Matched Pair No. 1

Logan County Matched Pair No. 1 considers the sale of a house located at 1442 700th Street, Mount Pulaski, that sold in April 2018 for $170,000. This house is located approximately 2,080 feet from the nearest turbine of HillTopper, which came online in 2018. The photograph below is an aerial view of the multiple turbines visible to the west of the house.

This property is compared with a similar property located at 488 100th Avenue, Athens, that sold in July 2017 for $158,000. This property is not located near wind turbines. Both properties are situated in rural locations. The salient details of these two properties are summarized in the following table.

LOGAN COUNTY MATCHED PAIR NO. 1		
	1A - Proximate to a Wind Turbine	**1B - Not Proximate to a Wind Turbine**
Address	1442 700th St. Mount Pulaski, IL 62548	488 100th Ave. Athens, IL 62613
Distance from Turbine (Ft.)	2,080	N/A
Sale Date	April 15, 2019	July 31, 2017
Sale Price	$170,000	$158,000
Sale Price/Sq. Ft. (A.G.)	$82.68	$81.61
Year Built	1910	1901
Building Size (Sq. Ft.)	2,056	1,936
Lot Size (Acres)	2.00	4.94
Style	Two-story; frame (vinyl/wood) 4 bedrooms, 2 bath	Two-story; frame (vinyl/brick) 4 bedrooms, 2 bath
Basement	N/A	Full, unfinished
Utilities	Central air; heat pump; well & septic	Central air; forced-air heating; well & septic
Other	barn with two parking spaces; deck, porch, and patio	2-car detached garage; deck, porch, and patio

488 100th Avenue

1442 700th Street

The house at 1442 700th Street, is located approximately 2,080 feet away from the nearest turbine, in a rural area. Both houses are of similar vintage, similar building size, located in a similar rural location, have a similar building style, have similar utilities, and have similar outbuildings. The 1442 700th Street property was sold in slightly superior market conditions. The 488 100th Avenue property has a superior lot size and has a superior basement.

ADJUSTMENT GRID MATCHED PAIR NO. 1

Sale No.	Address	Sale Date	Year Built	Building Size	Lot Size	Location	Style	Basement	Utilities	Out-Buildings
1B	488 100th Ave. Athens, IL 62613	+	O	O	-	O	O	-	O	O

\+ Positive adjustment based on comparable being inferior in comparison to property #1A
\- Negative adjustment based on comparable being superior in comparison to property #1A
O No adjustment necessary

Upward adjustments are made to the 488 100th Avenue property for the superior market conditions of the 1442 700th Street property. Downward adjustments are made for the larger lot size and superior basement of the 488 100th Avenue property compared to the basement of the 1442 700th Street property. The two properties have essentially the same vintage, building size, location, style, utilities, and outbuildings. Therefore, although the two properties give the impression of being similar in many categories, the higher per square foot sale price for the 1442 700th Street property appears to not support a finding that there is a negative impact on value resulting from the proximity of the 1442 700th Street property to a wind turbine.

Illinois Analysis - Lee County Matched Pair No. 1

Lee County Matched Pair No. 1 considers the sale of a house located at 956 Bingham Road, Steward, that sold in November 2017 for $185,000. This house is located approximately 735 feet from the nearest turbine of the Mendota Hills Wind Farm, which originally came online in 2003 and was subsequently renewed in 2019. The photograph below is an aerial view of the multiple turbines visible each direction of the house.

This property is compared with a similar property located at 3535 Elva Road, Steward, that sold in June 2018 for $180,000. This property is not located near wind turbines. Both properties are situated in rural locations. The salient details of these two properties are summarized in the following table.

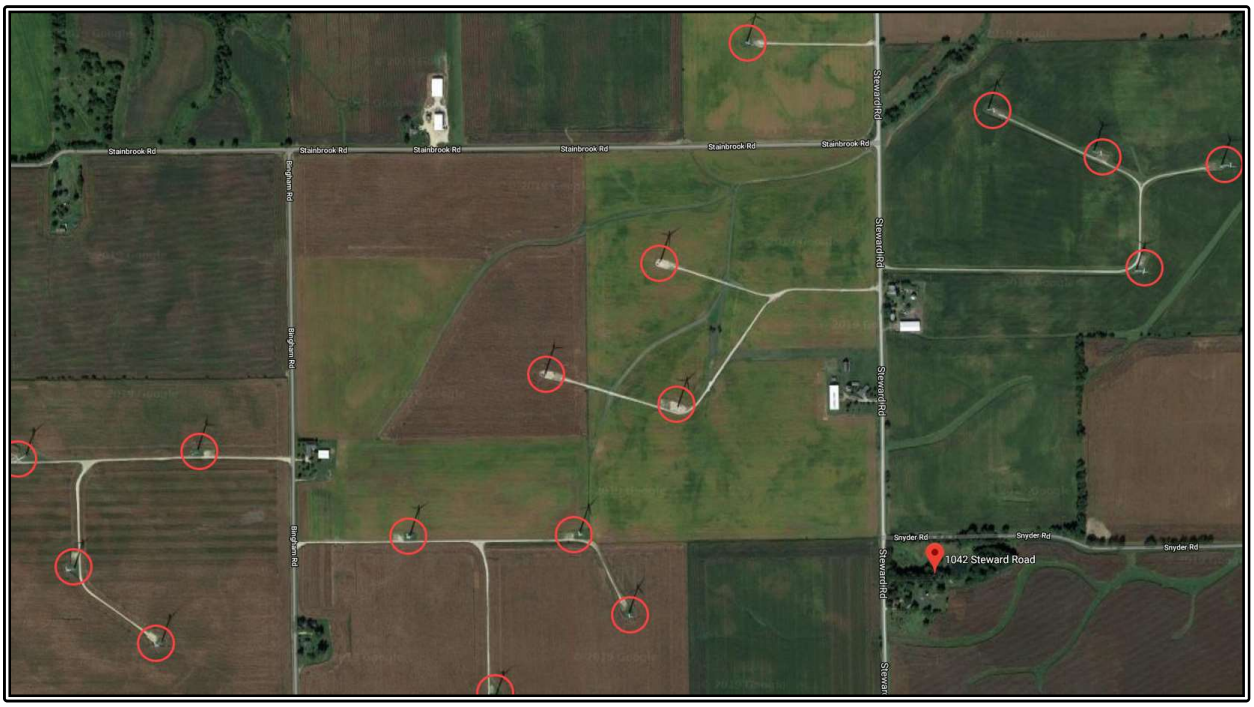
LEE COUNTY MATCHED PAIR NO. 1		
	1A - Proximate to a Wind Turbine	**1B - Not Proximate to a Wind Turbine**
Address	956 Bingham Rd. Steward, IL 60553	3535 Elva Rd. Steward, IL 60553
Distance from Turbine (Ft.)	735	N/A
Sale Date	November 29, 2017	June 24, 2018
Sale Price	$185,000	$180,000
Sale Price/Sq. Ft. (A.G.)	$100.00	$87.89
Year Built	1900	1972
Building Size (Sq. Ft.)	1,850	2,048
Lot Size (Acres)	2.41	3.22
Style	Two-story; frame (vinyl) 4 bedrooms, 2 bath	One-story; frame (vinyl) 4 bedrooms, 2 bath
Basement	Full	Full, partially finished
Utilities	Wall-unit air; radiant heat; well & septic	Hydronic heating; well & septic
Other	2-car detached garage; storage shed; deck, porch, and patio	3-car attached garage; storage shed, horse paddock; porch, and patio

956 Bingham Road

3535 Elva Road

The house at 956 Bingham Road, is located approximately 735 feet away from the nearest turbine, in a rural area. Both houses were sold in similar market conditions, have similar lot sizes, located in a similar rural location, and have similar basements. The 956 Bingham Road property has a superior building style and has superior utilities. The 3535 Elva Road property is of a superior vintage, superior building size, and has superior outbuilding.

ADJUSTMENT GRID MATCHED PAIR NO. 1



Sale No.	Address	Sale Date	Year Built	Building Size	Lot Size	Location	Style	Basement	Utilities	Out-Buildings
1B	3535 Elva Rd. Steward, IL 60553	o	-	-	o	o	+	o	+	-
+	Positive adjustment based on comparable being inferior in comparison to property #1A									
-	Negative adjustment based on comparable being superior in comparison to property #1A									
o	No adjustment necessary									

Upward adjustments are made to the 3535 Elva Road property for the superior building style and utilities of the 956 Bingham Road. Downward adjustments are made for the superior vintage, building size, and outbuildings of the 3535 Elva Road property compared to those features of the 956 Bingham Road property. The two properties have essentially the same market conditions, lot size, location, and basements. Therefore, although the 3535 Elva Road property gives the impression of being superior, the higher per square foot sale price for the 956 Bingham Road property appears to not support a finding that there is a negative impact on value resulting from the proximity of the 956 Bingham Road property to a wind turbine.

Illinois Analysis - Lee County Matched Pair No. 2

Lee County Matched Pair No. 2 considers the sale of a house located at 1042 Steward Road, Steward, that sold in July 2017 for $320,000. This house is located approximately 1,780 feet from the nearest turbine of the Mendota Hills Wind Farm, which originally came online in 2003 and was subsequently renewed in 2019. The following photograph is an aerial view of the multiple turbines visible to the west of the house.

This property is compared with a similar property located at 3377 Willow Creek Road, Lee, that sold in February 2018 for $319,000. This property is not located near wind turbines. Both properties are situated in rural locations. The salient details of these two properties are summarized in the following table.

LEE COUNTY MATCHED PAIR NO. 2		
	2A - Proximate to a Wind Turbine	**2B - Not Proximate to a Wind Turbine**
Address	1042 Steward Rd. Steward, IL 60553	3377 Willow Creek Rd. Lee, IL 60530
Distance from Turbine (Ft.)	1,780	N/A
Sale Date	July 27, 2017	February 15, 2018
Sale Price	$320,000	$319,000
Sale Price/Sq. Ft. (A.G.)	$181.82	$141.34
Year Built	1936	2002
Building Size (Sq. Ft.)	1,760	2,257
Lot Size (Acres)	9.08	2.00
Style	Two-story; frame (brick) 4 bedrooms, 2 bath	One-story; frame (vinyl) 6 bedrooms, 2 bath
Basement	Full	Full, finished 2,000 sq. ft. walkout
Utilities	Central air; forced-air heating; well & septic	Central and geothermal air; geothermal heating; well & septic
Other	2-car detached garage; pole barn; pond, porch, and patio	2-car attached garage; machine shed with 1-car garage two-tiered deck, porch, patio, and pool

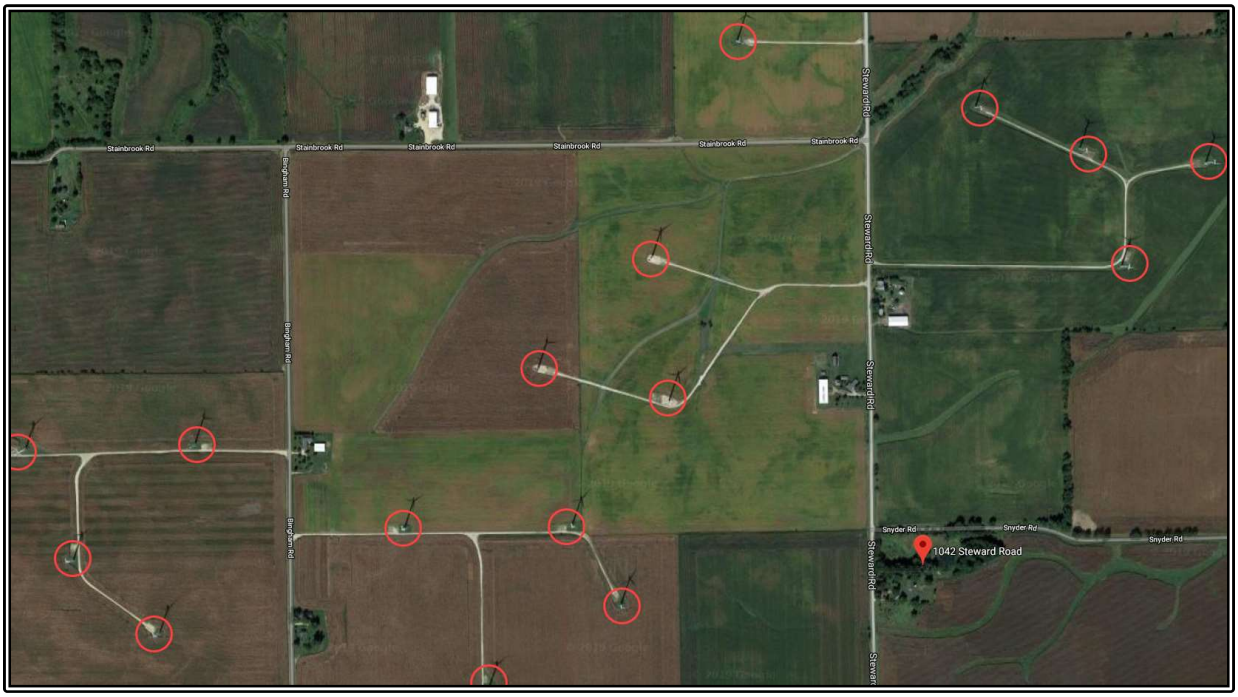
1042 Steward Road

3377 Willow Creek Road

The house at 1042 Steward Road, is located approximately 1,780 feet away from the nearest turbine, in a rural area. Both houses were sold in similar market conditions and located in a similar rural location. The 1042 Steward Road property has a superior lot size. The 3377 Willow Creek Road property is of a superior vintage, has a superior building size, is of a superior building style, has a superior basement, has superior utilities, and has superior outbuildings.

ADJUSTMENT GRID MATCHED PAIR NO. 2

Sale No.	Address	Sale Date	Year Built	Building Size	Lot Size	Location	Style	Basement	Utilities	Out-Buildings
2B	3377 Willow Creek Rd. Lee, IL 60530	O	-	-	+	O	-	-	-	-



\+ Positive adjustment based on comparable being inferior in comparison to property #1A
\- Negative adjustment based on comparable being superior in comparison to property #1A
O No adjustment necessary

Upward adjustments are made to the 3377 Willow Creek Road property for the larger lot size of the 1042 Steward Road property. Downward adjustments are made for the superior vintage, building size, style, basement, utilities, and outbuildings of the 3377 Willow Creek Road property compared to those features of the 1042 Steward Road property. The two properties have essentially the same market conditions and location. Therefore, although the 3377 Willow Creek Road property gives the impression of being superior, the higher per square foot sale price for the 1042 Steward Road property appears to not support a finding that there is a negative impact on value resulting from the proximity of the 1042 Steward Road property to a wind turbine.

Illinois Analysis - Lee County Matched Pair No. 3

Lee County Matched Pair No. 3 considers the prior sale of a house located at 1042 Steward Road, Steward, that sold in August 2009 for $240,000. This house is located approximately 1,780 feet from the nearest turbine of the Mendota Hills Wind Farm, which originally came online in 2003 and was subsequently renewed in 2019. The photograph below is an aerial view of the multiple turbines visible to the west of the house.

This property is compared to the prior sale of a similar property located at 3535 Elva Road, Steward, that sold in June 2013 for $96,253. As well as a prior sale of a similar property located at 3377 Willow Creek Road, Lee, that sold in February 2014 for $150,000. These property are not located near wind turbines. All three of the properties are situated in rural locations. The salient details of these three properties are summarized in the following table.

LEE COUNTY MATCHED PAIR NO. 3
(PRIOR SALES)

	3A - Proximate to a Wind Turbine	3B - Not Proximate to a Wind Turbine	3B - Not Proximate to a Wind Turbine
Address	1042 Steward Rd. Steward, IL 60553	3535 Elva Rd. Steward, IL 60553	3377 Willow Creek Rd. Lee, IL 60530
Distance from Turbine (Ft.)	1,780	N/A	N/A
Sale Date	August 13, 2009	March 22, 2013	December 15, 2014
Sale Price	$240,000	$96,253	$150,000
Sale Price/Sq. Ft. (A.G.)	$136.36	$47.00	$66.46
Year Built	1936	1972	2002
Building Size (Sq. Ft.)	1,760	2,048	2,257
Lot Size (Acres)	9.08	3.22	2.00
Style	Two-story; frame (brick) 4 bedrooms, 2 bath	One-story; frame (vinyl) 4 bedrooms, 2 bath	One-story; frame (vinyl) 6 bedrooms, 2 bath

1042 Steward Road

3535 Elva Road

3377 Willow Creek Road

Both the 1042 Steward Road and the 3535 Elva Road properties are located in a similar rural location, have a similar building style, and have similar basements. The 1042 Steward Road property and has a superior lot size and has superior utilities. The 3535 Elva Road property was sold in superior market conditions, is of a superior vintage, has a superior building size, and has superior outbuildings.

Both the 1042 Steward Road and the 3377 Willow Creek Road properties are located in a similar rural location. The 1042 Steward Road property has a superior lot size. The 3377 Willow Creek Road property was sold in superior market conditions, is of a superior vintage, has a superior building size, is of a superior building style, has a superior basement, has superior utilities, and has superior outbuildings.

ADJUSTMENT GRID MATCHED PAIR NO. 3
(PRIOR SALES)

Sale No.	Address	Sale Date	Year Built	Building Size	Lot Size	Location	Style	Basement	Utilities	Out-Buildings
3B	3535 Elva Rd. Steward, IL 60553	-	-	-	+	O	O	O	+	-
3C	3377 Willow Creek Rd. Lee, IL 60530	-	-	-	+	O	-	-	-	-

\+ Positive adjustment based on comparable being inferior in comparison to property #1A
\- Negative adjustment based on comparable being superior in comparison to property #1A
O No adjustment necessary

Upward adjustments are made to the 3535 Elva Road property for the larger lot size and the superior utilities of the 1042 Steward Road property. Downward adjustments are made for the superior market conditions, vintage, building size, and outbuildings of the 3535 Elva Road property compared to those features of the 1042 Steward Road property. The two properties have essentially the same location, style, and basements.

Upward adjustments are made to the 3377 Willow Creek Road property for the larger lot size of the 1042 Steward Road property. Downward adjustments are made for the superior market conditions, vintage, building size, style, basement, utilities, and outbuildings of the 3377 Willow Creek Road property compared to those features of the 1042 Steward Road property. The two properties have essentially the same location.

The 2013 prior sale of the 3535 Elva Road and the 2014 prior sale of the 3377 Willow Creek Road properties give the impression of being superior including, selling during the recovery of the housing market recession, compared to selling during the peak of the recession, such as the 2009 prior sale of the 1042 Steward Road property. However, the higher per square foot sale of the 2009 prior sale for the property appears to not support a finding that there is a negative impact on value resulting from the proximity of the 1042 Steward Road property to a wind turbine.

Matched Pair Analysis – Indiana, Minnesota, Iowa, and Kansas

In addition to analyzing sales in the subject project area, we have researched sales in proximity to several existing wind farms in rural areas of Indiana, Minnesota, Iowa, and Kansas in order to discover whether residential property values in these areas were impacted by their locations. The following are the results of the most recent of these studies.

As with the research from Illinois, details of these sales are retained in my office files; maps in the addenda to this report illustrate the location of these matched pairs. Unless otherwise indicated, none of the purchasers in these transactions appear to own any other property in proximity, and none of the transactions appear to have a wind turbine lease associated with the property.

Indiana Analysis - White County Matched Pair No. 1

White County Matched Pair No. 1 considers the sale of a house located at 8365 West State Road 18, Brookston, that sold in December 2017 for $159,900. This house is located approximately 2,340 feet from the nearest turbine of the Meadow Lake Wind Farm, which came online in 2009, and there are several turbines visible in each direction. The photograph below is an aerial view of the turbines visible surrounding the house.

This property is compared with a similar property located at 1105 South Airport Road, Monticello, that sold in December 2017 for $173,200. This property is not located near wind turbines. Both properties are situated in rural locations. The salient details of these two properties are summarized in the following table.

WHITE COUNTY MATCHED PAIR NO. 1		
	1A - Proximate to a Wind Turbine	**1B - Not Proximate to a Wind Turbine**
Address	8365 W State Road 18 Brookston, IN 47923	1105 S Airport Rd. Monticello, IN 47960
Distance from Turbine (Ft.)	2,340	N/A
Sale Date	December 27, 2017	December 18, 2017
Sale Price	$159,900	$173,200
Sale Price/Sq. Ft. (A.G.)	$90.34	$70.78
Year Built	2003	1927
Building Size (Sq. Ft.)	1,770	2,447
Lot Size (Acres)	2.09	1.64
Style	One-story; frame (brick) 3 bedrooms, 2 bath	Two-story; frame (vinyl) 5 bedrooms, 2.5 bath
Basement	Crawlspace	Partial/Crawlspace
Utilities	Central air; forced-air heat; well & septic	Central air; other heating; well & septic
Other	2-car attached garage; deck	1-car attached garage; 2-car detached garage; pool

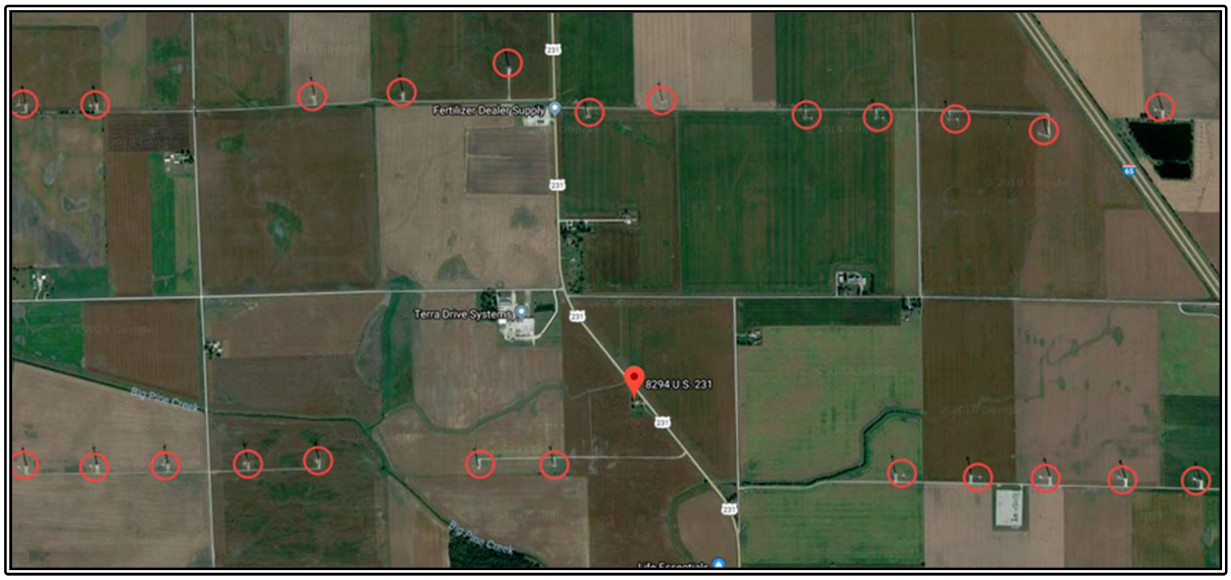
8365 West State Road 18

1105 South Airport Road

The house at 8365 West State Road 18, is located approximately 2,400 feet away from the nearest turbine, in a rural area. Both houses are located in a similar rural location, have similar utilities, and were sold in similar market conditions. The 8365 West State Road 18 property is of superior vintage and has a superior lot size. The 1105 South Airport Road property has a superior building size, a superior building style, and has a superior basement and outbuildings.

ADJUSTMENT GRID MATCHED PAIR NO. 1

Sale No.	Address	Sale Date	Year Built	Building Size	Lot Size	Location	Style	Basement	Utilities	Out-Buildings
1B	1105 S Airport Rd. Monticello, IN 47960	O	+	-	+	O	-	-	O	-



\+ Positive adjustment based on comparable being inferior in comparison to property #1A
\- Negative adjustment based on comparable being superior in comparison to property #1A
O No adjustment necessary

Upward adjustments are made to the 1105 South Airport Road property for the superior vintage and the larger lot size of the 8365 West State Road 18 property. Downward adjustments are made for the superior building size, building style, basement, and outbuildings of the 1105 South Airport Road property compared to those features of the 8365 West State Road 18 property. The two properties have essentially the same location, utilities, and were sold in similar market conditions. Therefore, although the 1105 South Airport Road property give the impressions of being superior in many categories, the much higher per square foot sale price for the 8365 West State Road 18 property appears to not support a finding that there is a negative impact on value resulting from the proximity of the 8365 West State Road 18 property to a wind turbine.

Indiana Analysis - White County Matched Pair No. 2

White County Matched Pair No. 2 considers the sale of a house located at 8294 South US Highway 231, Brookston, that sold in September 2016 for $157,000. This house is located approximately 1,410 feet from the nearest turbine of the Meadow Lake Wind Farm, which came online in 2009, and there are several turbines visible in each direction. The following photograph is an aerial view of the turbines visible surrounding the house.

This property is compared with a similar property located at 6288 East Ash Court, Monticello, that sold in June 2017 for $150,800. This property is not located near wind turbines. Market conditions are considered to be similar. The salient details of these two properties are summarized in the following table.

WHITE COUNTY MATCHED PAIR NO. 2		
	2A - Proximate to a Wind Turbine	**2B - Not Proximate to a Wind Turbine**
Address	8294 S US Highway 231 Brookston, IN 47923	6288 E Ash Ct. Monticello, IN 47960
Distance from Turbine (Ft.)	1,410	N/A
Sale Date	September 23, 2016	June 22, 2017
Sale Price	$157,000	$150,800
Sale Price/Sq. Ft. (A.G.)	$80.60	$59.23
Year Built	1926	1968
Building Size (Sq. Ft.)	1,948	2,546
Lot Size (Acres)	1.35	1.44
Style	One-story; frame (vinyl)	Two-story; frame (vinyl/brick)
	5 bedrooms, 2 bath	5 bedrooms, 2.5 bath
Basement	Crawlspace	Crawlspace
Utilities	Central air; forced-air heat; well & septic	Central air; forced-air heat; well & septic
Other	2-car attached garage	1-car attached garage; 2-car detached garage; deck

8294 South US Highway 231

6288 East Ash Court

The house at 8294 South US Highway 231, is located approximately 1,410 feet away from the nearest turbine, in a rural area. Both houses have a similar lot size, a similar rural location, have similar basements, and similar utilities. The 6288 East Ash Court property is of superior building size, building style, vintage, outbuildings, and was sold in superior market conditions.

ADJUSTMENT GRID MATCHED PAIR NO. 2

Sale No.	Address	Sale Date	Year Built	Building Size	Lot Size	Location	Style	Basement	Utilities	Out-Buildings
2B	6288 E Ash Ct. Monticello, IN 47960	-	-	-	O	O	-	O	O	-

\+ Positive adjustment based on comparable being inferior in comparison to property #2A

\- Negative adjustment based on comparable being superior in comparison to property #2A

O No adjustment necessary

Downward adjustments were made for the superior market conditions, vintage, building size, building style, and outbuildings of the 6288 East Ash Court property compared to the 8294 South US Highway 231 property. The two properties have essentially the same location, lot size, basement, and utilities. Therefore, although the 6288 East Ash Court property give the impressions of being superior in many categories, the much higher per square foot sale price for the 8294 South US Highway 231 property appears to support the conclusion that there is not any negative impact in value resulting from the proximity of the 8294 South US Highway 231 property to a wind turbine.

Minnesota Analysis - Freeborn County Matched Pair No. 1

Freeborn County, Minnesota, is located north adjacent to central Iowa. Matched Pair #1 considers the sale of a property in the footprint of the Bent Tree Wind Farm in Freeborn County, which has been operational since February 2011. The house is located at 69525 305th Street, Hartland, sold in March 2016. This house is approximately 2,375 feet from the nearest turbine; there are several turbines located to the south and southeast.

This sale is compared with a similar property located at 70308 240th Street, Albert Lea, that sold in May 2016. Wind turbines are visible from the house, but the turbines are more than 1.5 miles away. The location is very rural in nature. Market conditions are considered to be substantially similar at the dates of sale. The salient details of these two properties are summarized in the table below.

FREEBORN COUNTY MATCHED PAIR NO. 1

	1A - Proximate to a Wind Turbine	1B - Not Proximate to a Wind Turbine
Address	69525 305th Street. Hartland, MN 56042	70308 240th Street. Albert Lea, MN 56007
Distance from Turbine	2,375 Feet	NA
Sale Date	March 31, 2016	May 16, 2016
Sale Price	$89,000	$100,000
Sale Price/Sq. Ft. (A.G.)	$57.12	$61.80
Year Built	1880	1925
Building Size (Sq. Ft.)	1,558	1,618
Lot Size (Acres)	5.51	4.01
Style	Farmhouse; frame (vinyl) 3 or 4 bedrooms, 2 bath	Farmhouse; frame (vinyl) 3 bedrooms, 2 bath
Basement	Full, unfinished	Partial, unfinished
Utilities	No central air; propane heat; Well & septic	Central air; natural gas heat; Well & septic
Other	2-car detached garage; deck, outbuildings	2.5-car detached garage; deck, outbuildings

69525 305th Street

70308 240th Street

Both properties are older, farm-house style and of frame construction with vinyl siding. They are somewhat similar in size. However, the 240th Street house is superior to the 305th Street house in condition; it is classified by the Assessor as being in better condition and is described in the online listing as having been renovated recently. The 305th Street house does not have central air conditioning, and does not have natural gas available; however, the 240th Street house has both. Both the central air conditioning and the availability of natural gas are considered superior factors for 240th Street requiring a downward adjustment. An upward adjustment for the full basement of 305th Street compared to the partial basement of 240th Street.

The house on 240th Street has a site size approximately 1.5 acres smaller than that of the 305th Street house. However, this is more than offset by its location on a hard-surface road, as well as the proximity to Interstate 90 access and to the city of Albert Lea.

ADJUSTMENT GRID MATCHED PAIR NO. 1

SALE NO.	ADDRESS	SALE DATE	YEAR BUILT	BUILDING SIZE	LOT SIZE	LOCATION	STYLE	BASEMENT	UTILITIES	OUT-BUILDINGS
1B	70308 240th St. Albert Lea, Minnesota	O	-	O	O	-	O	+	-	O

\+ Positive adjustment based on comparable being inferior in comparison to property #1A
\- Negative adjustment based on comparable being superior in comparison to property #1A
O No adjustment necessary

When the adjustments noted above for superior condition, air conditioning, and the availability of natural gas are made to the sale price of the 240th Street house, the two properties have essentially the same per square foot value. In other words, the higher per foot sale price for the 240th Street house is justified by its superior condition and amenities. Thus, the difference in the sale price does not support the conclusion that proximity to the wind turbines had a negative impact on the sale price of the property at 69525 305th Street.

Kansas Analysis - Coffey County Matched Pair No. 1

Coffey County Matched Pair No. 1 considers the sale of a house located at 2045 Trefoil Road Northeast, Waverly, that sold in November 2018 for $162,500. This house is located approximately 1,960 feet from the nearest turbine of the Waverly Wind Farm, which came online in 2016, and there are several turbines visible in each direction.

The following photograph is an aerial view of the turbines visible surrounding the house.

This property is compared with a similar property located at 1804 North C Street, Le Roy, that sold in June 2018 for $120,000. This property is not located near wind turbines. Both properties are situated in rural locations. The salient details of these two properties are summarized in the table below.

COFFEY COUNTY MATCHED PAIR NO. 1		
	1A - Proximate to a Wind Turbine	**1B - Not Proximate to a Wind Turbine**
Address	2045 Trefoil Rd. NE Waverly, KS 66871	1804 North C St. Le Roy, KS 66857
Distance from Turbine (Ft.)	1,960	N/A
Sale Date	November 19, 2018	June 15, 2018
Sale Price	$162,500	$120,000
Sale Price/Sq. Ft. (A.G.)	$113.80	$39.53
Year Built	1977	2002
Building Size (Sq. Ft.)	1,428	3,036
Lot Size (Acres)	12.00	0.50
Style	One-story; frame (vinyl) 3 bedrooms, 2 bath	One-story; frame (brick) 4 bedrooms, 3 bath
Basement	Full, unfinished walkout	Full, partial finished
Utilities	Central air; forced-air heat/heat pump; well & septic	Central air; forced-air heating; well & septic
Other	Fully stocked pond	2-car attached garage; 2-car detached garage; porch

2045 Trefoil Road Northeast

1804 North C Street

The house at 2045 Trefoil Road Northeast, is located approximately 1,960 feet away from the nearest turbine, in a rural area. Both houses are located in a similar rural location with paved roads, have similar utilities, have similar basements, and were sold in similar market conditions. The 2045 Trefoil Road Northeast property has a superior lot size. The 1804 North C Street property has a superior vintage, a superior building size, a superior building style, and has superior outbuildings.

ADJUSTMENT GRID MATCHED PAIR NO. 1

Sale No.	Address	Sale Date	Year Built	Building Size	Lot Size	Location	Style	Basement	Utilities	Out-Buildings
1B	1804 North C St. Le Roy, KS 66857	O	-	-	+	O	-	O	O	-
+	Positive adjustment based on comparable being inferior in comparison to property #1A									
-	Negative adjustment based on comparable being superior in comparison to property #1A									
O	No adjustment necessary									

Upward adjustments are made to the 1804 North C Street property for the larger lot size of the 2045 Trefoil Road Northeast property. Downward adjustments are made for the superior vintage, building size, building style, and outbuildings of the 1804 North C Street property compared to those features of the 2045 Trefoil Road Northeast property. The two properties have essentially the same location, utilities, and were sold in similar market conditions. Therefore, although the 1804 North C Street property gives the impression of being superior in many categories, the much higher per square foot sale price for the 2045 Trefoil Road Northeast property appears to not support a finding that there is a negative impact on value resulting from the proximity of the 2045 Trefoil Road Northeast property to a wind turbine.

Kansas Analysis - Harper County Matched Pair No. 1

Harper County Matched Pair No. 1 considers the sale of a house located at 330 Northwest 150th Road, Harper, that sold in July 2017 for $385,000. This house is located approximately 1,330 feet from the nearest turbine of the Flat Ridge II Wind Farm, which came online in 2013, and there are several turbines visible in each direction. The following photograph is an aerial view of the turbines visible surrounding the house.

This property is compared with a similar property located at 750 Northeast 110th Road, Danville, that sold in January 2017 for $174,900. This property is not located near wind turbines. Market areas are considered to be similar. The salient details of these two properties are summarized in the following table.

HARPER COUNTY MATCHED PAIR NO. 1		
	1A - Proximate to a Wind Turbine	**1B - Not Proximate to a Wind Turbine**
Address	330 NW 150th Rd. Harper, KS 67058	750 NE 110th Rd. Danville, KS 67036
Distance from Turbine (Ft.)	1,330	N/A
Sale Date	July 14, 2017	January 1, 2017
Sale Price	$385,000	$174,900
Sale Price/Sq. Ft. (A.G.)	$120.46	$73.49
Year Built	1997	1955
Building Size (Sq. Ft.)	3,196	2,380

330 Northwest 150th Road

750 Northeast 110th Road

The house at 330 Northwest 150th Road, is located approximately 1,330 feet away from the nearest turbine, in a rural area. The 330 Northwest 150th Road property is of superior vintage and superior building size. The 750 Northeast 110th Road property has superior outbuildings compared to 330 Northwest 150th Road. Both houses were sold in similar market conditions, located in a similar rural location, have similar lot sizes, similar building styles, similar basements, and have similar utilities.

ADJUSTMENT GRID MATCHED PAIR NO. 1

Sale No.	Address	Sale Date	Year Built	Building Size	Lot Size	Location	Style	Basement	Utilities	Out-Buildings
1B	750 NE 110th Rd. Danville, KS 67036	O	+	+	O	O	O	O	O	-

\+ Positive adjustment based on comparable being inferior in comparison to property #1A
\- Negative adjustment based on comparable being superior in comparison to property #1A
O No adjustment necessary

Upward adjustments were made for the superior vintage and building size of the 330 Northwest 150th Road property compared to the 750 Northeast 110th Road property. Downward adjustments were made for the superior outbuildings of the 750 Northeast 110th Road property compared to those of the 330 Northwest 150th Road property. The two properties have essentially the same market conditions, location, style, basement, and utilities. Therefore, although the two properties give the impression of being similar in many categories, the much higher per square foot sale price for the 330 Northwest 150th Road property appears to support the conclusion that there is not any negative impact in value resulting from the proximity of the 330 Northwest 150th Road property to a wind turbine.

Kansas Analysis - Pratt County Matched Pair No. 1

Pratt County Matched Pair No. 1 considers the sale of a house located at 40206 Southeast 30th Street, Pratt, that sold in January 2018 for $195,000. This house is located approximately 2,710 feet from the nearest turbine of the Ninnescah Wind Farm, which came online in 2016, and there are several turbines visible towards the southern direction of the property.

The following photograph is an aerial view of the turbines visible surrounding the house.

This property is compared with a similar property located at 1517 Eastland Place, Pratt, that sold in December 2017 for $230,000. This property is not located near wind turbines. Both properties are situated in rural locations. The salient details of these two properties are summarized in the table below.

PRATT COUNTY MATCHED PAIR NO. 1

	1A - Proximate to a Wind Turbine	1B - Not Proximate to a Wind Turbine
Address	40206 SE 30th St. Pratt, KS 67124	1517 Eastland Pl. Pratt, KS 67124
Distance from Turbine (Ft.)	2,710	N/A
Sale Date	January 29, 2018	December 11, 2017
Sale Price	$195,000	$230,000
Sale Price/Sq. Ft. (A.G.)	$106.56	$59.85
Year Built	2002	2010
Building Size (Sq. Ft.)	1,830	3,843
Lot Size (Acres)	10.01	0.29
Style	One-story; frame (brick) 3 bedrooms, 2 bath	One-story; frame (brick) 5 bedrooms, 3 bath
Basement	N/A	Full, finished
Utilities	Central air; propane gas heat; well & septic	Central air; forced-air heating; public water & sewer
Other	2-car attached garage; 3-bay work shed & storage building; deck, patio, pool, pond, creek	2-car attached garage; cul-de-sac; porch & deck

40206 Southeast 30th Street

1517 Eastland Place

The house at 40206 Southeast 30th Street, is located approximately 2,710 feet away from the nearest turbine, in a rural area. Both houses are of similar building styles, are of similar vintage, and were sold in similar market conditions. The 40206 Southeast 30th Street property has a superior lot size and superior outbuildings. The 1517 Eastland Place property has a superior building size, a superior basement, a superior location on a paved cul-de-sac, and has superior utilities.

ADJUSTMENT GRID MATCHED PAIR NO. 1

Sale No.	Address	Sale Date	Year Built	Building Size	Lot Size	Location	Style	Basement	Utilities	Out-Buildings
1B	1517 Eastland Pl. Pratt, KS 67124	o	o	-	+	-	o	-	-	+

\+ Positive adjustment based on comparable being inferior in comparison to property #1A
\- Negative adjustment based on comparable being superior in comparison to property #1A
o No adjustment necessary

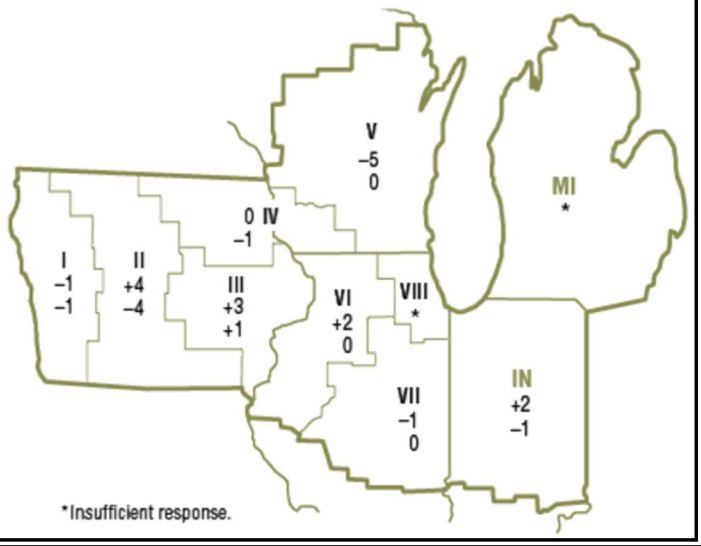
Upward adjustments are made to the 1517 Eastland Place property for the larger lot size and superior outbuildings of the 40206 Southeast 30th Street property. Downward adjustments are made for the superior building size, location, basement, and utilities of the 1517 Eastland Place property compared to those features of the 40206 Southeast 30th Street property. The two properties have essentially the same style, vintage, and were sold in similar market conditions. Therefore, although the 1517 Eastland Place property gives the impression of being superior in many categories, the much higher per square foot sale price for the 40206 Southeast 30th Street property appears to not support a finding that there is a negative impact on value resulting from the proximity of the 40206 Southeast 30th Street property to a wind turbine.

Matched Pair Analysis Conclusions

Studies in Illinois and studies in rural counties of Indiana, Minnesota, Iowa, and Kansas comparing sales of properties proximate to wind turbines with similar properties selling under similar market conditions without proximity to wind turbines have not discovered any sales in which proximity to wind turbines appears to have had a negative impact on property values. Therefore, the conclusion is that there does not appear to have been any measurable negative impact on surrounding residential property values due to the proximity of a wind farm

Agricultural Land Values

Agricultural land values are typically tied to the productivity of the land and to the commodity prices of crops like corn and soybeans. Other factors include favorable interest rates and the supply of land compared to the number of buyers. The May 2019 edition of the *AgLetter,* published by the Federal Reserve Bank of Chicago from the Federal Reserve 7th District, which includes Morgan County, stated that agricultural land values for the Seventh Federal Reserve District as a whole remained stable in the first quarter of 2019, with average farmland values unchanged from a year earlier. "There was a 1% increase in 'good' farmland values from the fourth quarter of 2018 to the first quarter of 2019, according to the survey responses of 168 District agricultural bankers. The amount of farmland for sale in the three- to six-month period ending with March 2019 was slightly higher than in the same period ending with March 2018, even as the demand to purchase agricultural land was a bit lower. Also, the number of farms sold, and the amount of acreage sold were roughly the same during the winter and early spring of 2019 compared with a year ago. Almost a quarter of the responding bankers expected District farmland values to decrease during the second quarter of 2019, while three-fourths of them expected agricultural land values to be steady. Moreover, cash rental rates for District farmland eased for the sixth consecutive year in 2019."[3]



Agricultural land values are typically tied to the productivity of the land and to the commodity prices of crops like corn and soybeans. According the 2019 edition of the annual publication of *Illinois Land Values and Lease Trends,* other factors include favorable interest rates, and the supply of land compared to the number of buyers. The following charts illustrate the prices of average-productivity agricultural land sold in the west-central region of Illinois, which includes Morgan County, in 2018 were between $4,000 per acre and $6,000 per acre. These values were a 5% to 7% decrease from 2017. The prices of excellent-productivity agricultural land sold in 2018 were between $9,750 per acre and $12,000 per acre. These values were a 2% to 5% decrease from 2017. "Although the data suggest a generally mild decline in values, at times it felt like it would be much worse. [The west-central region] continues to find more sustainability than some expected. Overall, 2018 (like 2017 and 2016) felt like an emotional rollercoaster at times but we still see an interest in farmland with buyers in the market." Additionally, "Energy projects continue to be a common conversation in large parts of [the west-central region]. It remains to be seen how they will develop, if at all, but large-scale wind and solar projects are being discussed. If these large projects come to fruition, it could affect the land market but to what extent remains to be seen. We have seen some owners participating in these projects use their payments/bonuses for additional land purchases." [4]

	Land Sale #5 - 4 Fields	$756,000	3/28/18	241.71	142.2	$3,127.72
	Summary Averages:				**136.1**	**$11,826.01**
	Sangamon County Averages:				**125.5**	**$9,239.00**

The research of land sales in Morgan County, Illinois discovered that the county did not have relevant land sales, therefore, the above analysis includes land sales that are nearest to the project footprint in Sangamon County, Illinois. The above summary of land sales[5] reveal that the agricultural land nearest to the area of the project footprint is of above-average quality for, with an average Productivity Index of 136.1 compared to the county's overall average Productivity Index of 125.5. Adding wind turbines and land leases should only add value to the land prices and farm revenue benefit of the above-average land, and then benefit the land prices and farm revenue of the parcels with average or below-average land by adding an extra steady income stream.

Agricultural Land Sales near Wind Farms

The research was not exhaustive, however, in Illinois there was one reported sale of agricultural land close to wind turbines located in McLean County, Illinois, in March 2013. The farm, comprised of two tracts, was considered "highly desirable" with a productivity rating of 135 and 132 respectively (the low end of the excellent range.) The report commented, "...the wind turbine lanes were not a nuisance as they ran the same direction as the farm is planted (north–south.)" In 2014, there were three sales of farms with wind turbines in Region 4, which includes the counties of Marshall, Woodford, Mason, Putnam, Livingston, McLean, and Tazewell. The report stated, "In general, investors may have paid a premium for the wind turbine. High quality farmland with wind turbines is stable."

Another reported sale in November 2017 was to be associated with wind turbines within Jerauld County, South Dakota, which is home to the Wessington Springs Wind Farm and has similar demographics as the project area. The property is situated on pastureland of poor quality with significant topography issues, which would reflect a lower price per acre than the region's average price of $2,011 per acre. However, the sale included multiple wind turbine leases, and sold with an above average price per acre of $2,800, which signifies a direct correlation to the benefit associated with the turbines on the land.

Wind turbines typically are considered to be of significant benefit to farmers. For example, Iowa farmers interviewed by the *Omaha World Herald*, were positive about the stable income as opposed to the vicissitudes of commodity prices.[6] Franklin County, Iowa reported lowering real estate taxes for the county as a whole because of the taxes generated by the wind turbines in that county. Support for good prices comes from the lack of land for sale, stable commodity prices, and low interest rates. Marginal land in areas where wind turbines are located or proposed is popular with investors.[7]

A report was discovered for Illinois, the *2016 Illinois Land Values and Lease Trends*, indicated that the impact of wind turbine leases is being experienced in McLean, Livingston, and Woodford counties, where turbine leases have provided "income diversification, beyond agriculture, which makes these tracts more attractive to an outside investor."[8] Further, they noted that "investors are still paying a little more of a premium for the wind turbines just as they had in the past few years."[9] The report notes that the premium is related directly to the number of years left on the lease.

[8] *Klein, David E., and Schnitkey, Gary, 2016 Illinois Land Values and Lease Trends, Illinois Society of Professional Farm Managers and Rural Appraisers, Page 38.*
[9] *Ibid. Page 42.*

An updated report was discovered for Illinois, an article titled *Wind Energy and Farmland Values* in the *2018 Illinois Land Values and Lease Trends*, indicated that as of March 22, 2018, Illinois was home over to 27 wind projects that individually have a nameplate capacity of 50 megawatts or greater. Understanding Illinois and its major involvement in wind energy have allowed for several positive side effects besides allowing for cleaner energy. The first benefit is that it appears to impact land values in a positive way significantly. The typical capitalization rate for well-managed farmland in Illinois is usually between 2.5% to 3.5%. The capitalization rate for land with lease payments associated with wind projects is approximately 9%; appearing to be both far more lucrative and more efficient use of the land. A few more of the positive improvements that are associated with wind projects is that the township and county officials within the project area typically create plans with the project developers to repair and improve roads that were used during construction. In addition, the land that is undeveloped by the project developer is available for the discretionary use of the landowners. Different improvements like paved areas around turbines and gravel roads are left once the work is completed. With any improvements, there are always concerns and potential issues that may come to mind, but it appears that with each wind turbine project completed in Illinois derives a far better outcome than worse, when speaking of land values.[10]

Overall, it appears that there is little or no relationship between agricultural land values and the location of wind farms, with productivity being the driving force behind land values. However, wind farm lease revenue does appear to increase the marketability and value of the land benefiting from the lease.

Real Estate Professionals & Assessor Surveys 2016-2019

Real estate professionals from the surrounding market areas and in the Midwest were contacted to discuss market conditions, specific market transactions, and to investigate whether they had experience with or knowledge of any impact of wind farms on residential property values.

Joy Boyd, a local Illinois licensed broker in Christian County, has observed rural residential property values near the existing wind farm, Radford's Run, have not been negatively impacted due to the proximity to a wind turbine. Ms. Boyd also states that during peak farming season, other energy systems, such as solar panels, essentially disappear behind the crops on the land. Ms. Boyd also reported that rural residential properties in the general area overall are accepting of alternative uses for the land due to the proximity of existing intense agricultural uses: agricultural and industrial type buildings, gravel roads, and other intrusive uses of the land. It has been observed that the residents within Christian County and the surrounding counties have consistently agree that the only negative land use possibly impacting property values and buyers' decisions are the existing hog containment facilities within the county.

[10] *Klein, D., Baker, S., Sherrick, B., & Haight, B. (2018). Wind Energy and Farmland Values. 2018 Illinois Land Values and Lease Trends.*

Real estate professional, Joseph M. Webster, MAI, of Webster & Associates, Inc., Decatur, Illinois, was previously consulted within 2016 and 2017 for his extensive experience with agricultural, commercial, and residential values in the Decatur, and Macon County area, as well as the broader market area. Mr. Webster provided background information on the economic conditions as well as information on agricultural and residential values of the central Illinois area.

Michael Crowley, Sr., SRA of Real Estate Consultants, Ltd., Spring Valley, Illinois was consulted. Mr. Crowley has had extensive experience with wind farm development in Central Illinois, including projects in counties with similar demographics and character, such as Bureau, Whiteside, and Lee counties. Mr. Crowley has been unable to document any loss in property values attributable to the proximity of wind turbines.

Kansas broker, Mandy Collum of United Country Real Estate Professionals, states that the Neosho County residential market is very stable and has been stable over the past couple years. She also states that the county is very rural; therefore, residential sales are limited. Her view on the market indicates that the highest end for the residential market values range is typically $250,000 and the highest end for the agricultural land values is typically $3,300 per acre. Ms. Collum also pointed out that the market is demanding residential properties that are modern (which include modern energy sources, such as wind), well maintained, and show well to potential buyers. Properties with these features can be typically valued greater than $100,000.

Kansas broker, Stephanie Tuggle of Keller Williams Realty Select, states that Neosho County's residential market was affected heavily by the housing crisis that began in 2008 and continued through 2012; however, since 2012 the Neosho market has been slowly recovering and appears to be stable and at the peak of its market potential due to the discovery of some declining values throughout the county and due to values in the state trending downwards. Ms. Tuggle did not comment on her opinion of the range of values for residential properties; however, her opinion of the highest end for the agricultural land values is typically $3,000 per acre.

David Engelman, Kansas General Certified Appraiser, Wilson County, Kansas, was consulted. Mr. Engelman has had extensive experience with agricultural, commercial, and residential values in the Neosho County area, as well as the broader southeast Kansas market area.

Jim Aesoph of Aesoph Real Estate, Inc. is a broker with 27 years of experience in northeast South Dakota. MaRous and Company contacted Mr. Aesoph due to his highly regarded reputation in the region. He stated that he contacted the assessors of the adjacent Codington, Grant, and Roberts counties to discuss land prices in each respective county, and each of them informed Mr. Aesoph that they are not aware of any effect on land prices due to new wind projects in the area. He also stated that 5 years ago land prices were roughly $6,000 per acre, and now the average acre price is approximately $4,000. The reduction in land prices, he mentioned, is not due to the wind project, but due to the production of corn on the land.

Interviews were conducted with six auctioneers throughout South Dakota. Marshall Hansen of Bob Hansen Auction stated that while turbines closer to home could possibly keep a buyer away, in areas of low population the development of turbines has a positive effect on the area. Mr. Hansen also stated that chemicals, such as insecticides, pose a larger impact on wildlife and game birds than turbines. Lenny Burlage of Burlage-Peterson Auctions stated that turbines do not negatively affect residential values but can affect each individual person differently. Jackson Hagerfeld of Advantage Land Company stated that he does see any impact on land from wind turbines, and the recent land sale prices are driven up by the limited amount of properties on the market. Jim Thorpe of Thorpe Realty & Auction stated that turbine leases have positively impacted landowners with turbines on their land. Mr. Thorpe also stated that he had noticed a movement of buyers from larger cities buying properties that are being sold off by the aging population that is moving out of the area. Jeff Juffer of Juffer Incorporated stated that from the existing turbines within the Beethoven Wind Farm footprint have not had any effect, positive or negative, on the local market. Mr. Juffer also states that Avon and the immediate surrounding area is lacking in industry and would benefit from an outside influence to attract businesses to the area. Lastly, Glen Peterson of Peterson Auctioneers states that in the past two years there has been a demand for land that is not dependent on if a turbine is on the land or not, which can be assumed that turbines do not affect land sales in any way, positively or negatively.

Rick Mummert of Ron Holton Real Estate reported that residential conditions in both Freeborn and Mower counties in Minnesota had been stable through the last 3 years, primarily due to the very rural nature of the area; however, the area is benefitting from the low-interest rates. He reported that the Highway 14 corridor had experienced increases in residential values; in his opinion, the difference was due to the more developed nature of the area and the availability of jobs.

Interviews with brokers proximate to wind farms in Illinois yielded similar results. Although a number of them wished to remain anonymous, they stated that they did not believe that the proximity to wind turbines had any bearing on the sale prices of residential properties in the area.

Illinois Assessors Survey - Updated October 2016

In March 2015, and updated in October 2016, my office conducted a survey of the supervisor of assessments or a staff member in 18 counties in Illinois in which wind farms currently are operational. As of the third quarter of 2018, the AWEA reported there were 49 wind projects online with 2,632 wind turbines in the state with additional farms being added each year. The interviews were intended to allow the assessment officials to share their experience regarding the wind farm(s) impact upon the market values and/or assessed values of surrounding properties. The following is a summary of the results of that survey:

- Without exception, the interviewees reported that there was no market evidence to support a negative impact upon residential property values as a result of the development of and the proximity to a wind farm facility. In some counties, this results from the very rural nature of the area in which the projects are located;
- In the past 18 months, the assessor's offices have not experienced a real estate tax appeal based on wind farm-related concerns. There have been no reductions in assessed valuations related to wind turbines;[11]
- As the available market data do not support the claim of a negative impact upon residential values, residential assessed values have fluctuated consistently within counties as influenced by market conditions, with no regard for proximity to a wind farm;
- Agricultural properties are taxed based upon a productivity formula that is not impacted by market data and external influences.

Indiana Assessors Survey – January 2019

In January 2019, MaRous & Company conducted a survey of the supervisor of assessments or a staff member in 5 counties in Indiana in which wind farms with more than 25 turbines currently are operational. Of the wind farms with more than 25 turbines, Indiana contains more than 14 wind farms with more than 1,190 wind turbines. As of 2018, the AWEA reported there were approximately 16 wind projects with approximately 1,203 wind turbines in the state with additional farms being added each year. The interviews were intended to allow the assessment officials to share their experience regarding the wind farm(s) impact upon the market values and/or assessed values of surrounding properties. The following is a summary of the results of that survey:

- Without exception, the interviewees reported that there was no market evidence to support a negative impact upon residential property values as a result of the development of and the proximity to a wind farm facility. In some counties, this results from the very rural nature of the area in which the projects are located;

[11] *A lawsuit was apparently filed in 2013 against the Supervisor of Assessments in Vermilion County by a homeowner proximate to wind turbines; however, there has been no further action on the matter.*

- In the past 18 months, the assessor's offices have not experienced a real estate tax appeal based upon wind farm-related concerns. There have been no reductions in assessed valuations related to wind turbines;
- As the available market data does not support the claim of a negative impact upon residential values, residential assessed values have fluctuated consistently within counties as influenced by market conditions, with no regard for proximity to a wind farm;
- Agricultural properties are taxed based upon a productivity formula that is not impacted by market data and external influences.

Kansas Appraiser Survey – January 2019

In January 2019, MaRous & Company conducted a survey of the county appraiser or a staff member in 21 counties in Kansas in which wind farms with more than 25 turbines currently are operational. Of the wind farms with more than 25 turbines, Kansas contains more than 29 wind farms with more than 2,856 wind turbines. As of 2018, the AWEA reported there were approximately 37 wind projects with approximately 2,996 wind turbines in the state with additional farms being added each year. The interviews were intended to allow the assessment officials to share their experience regarding the wind farm(s) impact upon the market values and/or assessed values of surrounding properties. The following is a summary of the results of that survey:

- Without exception, the interviewees reported that there was no market evidence to support a negative impact upon residential property values as a result of the development of and the proximity to a wind farm facility. In some counties, this results from the very rural nature of the area in which the projects are located;
- In the past 18 months, the assessor's offices have not experienced a real estate tax appeal based upon wind farm-related concerns. There have been no reductions in assessed valuations related to wind turbines;
- As the available market data does not support the claim of a negative impact upon residential values, residential assessed values have fluctuated consistently within counties as influenced by market conditions, with no regard for proximity to a wind farm;
- Agricultural properties are taxed based upon a productivity formula that is not impacted by market data and external influences.

South Dakota Assessors Survey - November 2017, Updated April 2018

In November 2017 my office conducted a survey of the supervisor of assessments or a deputy supervisor in eight counties in South Dakota, then two additional counties in April 2018, in which wind farms with more than 25 turbines currently are operational, and South Dakota has more than nine wind farms with more than 510 wind turbines. As of the third quarter of 2018, the AWEA reported there were 14 wind projects online with 583 wind turbines in the state with additional farms being added each year. The interviews were intended to allow the assessment officials to share their experience regarding the wind farm(s) impact upon the market values and/or assessed values of surrounding properties. The detailed analysis is attached in the addenda at the end of this report. The following is a summary of the results of that survey:

- Without exception, the interviewees reported that there was no market evidence to support a negative impact upon residential property values as a result of the development of and the proximity to a wind farm facility. In some counties, this results from the very rural nature of the area in which the projects are located;
- In the past 5 years, the only assessor's office to have experienced a real estate tax appeal based upon wind farm-related concerns was Aurora County, but the appeal was denied by the county. There have been no reductions in assessed valuations related to wind turbines;
- As the available market data does not support the claim of a negative impact upon residential or agricultural values, residential and agricultural assessed values have fluctuated consistently within counties as influenced by market conditions, with no regard for proximity to a wind farm;
- Virtually all assessors volunteered that the wind farms provided positive economic benefits to their counties and, in fact, had a positive impact on real estate values.

Minnesota Assessors Survey - January 2017

In late January 2017, my office conducted a survey of the supervisor of assessments or a deputy supervisor in eight Minnesota counties where large numbers of wind turbines currently are operational. There are several counties with small numbers of wind turbines that were not included in the survey. As of the third quarter of 2018, the AWEA reported there were 98 wind projects online with 2,428 wind turbines in the state with additional farms being added each year. The interviews were intended to allow the assessment officials to share their experience regarding the wind farm(s) impact upon the market values and/or assessed values of surrounding properties. The following is a summary of the results of that survey:

- With one exception, the interviewees reported that there was no market evidence to support a finding that there has been a negative impact upon residential property values as a result of the development of and the proximity to a wind farm facility. In some counties, the assessors believed this to be the result of the very rural nature of the area in which the projects are located;
- The exception, the Dodge County Assessor, reported receiving two complaints from residential property owners regarding the value impact of proximity to wind turbines; however, the Assessor was unable to find data to support the contentions;
- Without exception, where there was sufficient data to analyze, the County Assessors reported that both residential and agricultural assessed property values within the wind farm footprints had fluctuated consistently within counties as influenced by market conditions, with no regard for proximity to a wind farm.

Bruce Nielson, Lincoln County Assessor, reported a recent residential transaction in a township in which wind turbines are located that sold $70,000 higher than the assessor's opinion of market value.

Iowa Assessors Survey - August/September 2017

In August and September 2017 my office conducted a survey of the supervisor of assessments or a staff member in 26 counties in Iowa in which wind farms with more than 25 turbines currently are operational. As of the third quarter of 2018, the AWEA reported there were 107 wind projects online with 4,145 wind turbines in the state with additional farms being added each year. The interviews were intended to allow the assessment officials to share their experience regarding the wind farm(s) impact upon the market values and/or assessed values of surrounding properties. The following is a summary of the results of that survey:

- Without exception, the interviewees reported that there was no market evidence to support a negative impact upon residential property values as a result of the development of and the proximity to a wind farm facility. In some counties, this results from the very rural nature of the area in which the projects are located;
- In the past 18 months, the assessor's offices have not experienced a real estate tax appeal based on wind farm-related concerns. There have been no reductions in assessed valuations related to wind turbines;
- As the available market data do not support the claim of a negative impact upon residential values, residential assessed values have fluctuated consistently within counties as influenced by market conditions, with no regard for proximity to a wind farm;
- Virtually all assessors volunteered that the wind farms provided positive economic benefits to their counties and, in fact, had a positive impact on real estate values;
- Agricultural properties are taxed based upon a productivity formula that is not impacted by market data and external influences.

Ohio Auditors Survey – July 2019

In July 2019, MaRous & Company conducted a survey of the County Auditors or a deputy auditor in 3 counties in which wind farms with more than 25 turbines currently are operational. Of the wind farms with more than 25 turbines, Ohio has more than 5 wind farms with more than 327 wind turbines. As of April 2019, the AWEA reported there were approximately 38 wind projects with approximately 382 wind turbines in the state with additional farms being added each year. The interviews were intended to allow the assessment officials to share their experience regarding the wind farm(s) impact upon the market values and/or assessed values of surrounding properties. The detailed analysis is attached in the addenda at the end of this report. The following is a summary of the results of that survey:

- Without exception, the interviewees reported that there was no market evidence to support a negative impact upon residential property values as a result of the development of and the proximity to a wind farm facility. In some counties, this results from the very rural nature of the area in which the projects are located;
- In the past 18 months, the assessor's offices have not experienced a real estate tax appeal based on wind farm-related concerns. There have been no reductions in assessed valuations related to wind turbines;
- As the available market data do not support the claim of a negative impact upon residential values, residential assessed values have fluctuated consistently within counties as influenced by market conditions, with no regard for proximity to a wind farm;
- Agricultural properties are taxed based upon a productivity formula that is not impacted by market data and external influences.

Literature Review

I am familiar with several academic and peer-reviewed studies on the impact of wind turbines on residential property values. There are no peer-reviewed studies for the state of Illinois. However the following studies are consistent with our findings in Illinois. These are summarized below:

Municipal Property Assessment Corporation (MPAC) Study, 2008, 2012, and 2016

Ontario, Canada

This study originally was conducted in 2008 and was updated in 2012 and 2016. The conclusions in all three studies are similar: "there is *no statistically significant impact on sale prices* of residential properties in these market areas resulting from proximity to an IWT [Industrial Wind Turbine] when analyzing sale prices." (2012 Study, Page 5; emphasis in original) Using 2,051 properties and generally accepted time adjustment techniques, MPAC "cannot conclude any loss in price due to the proximity of an IWT." (2012 Study, Page 29) Further, Appendix G of the 2012 MPAC report "Re-sale Analysis" states in the "Summary of Findings" "MPAC's own re-sale analysis using a generally accepted methodology for time adjustment factors indicates no loss in price based on proximity to the nearest IWT."

Lawrence Berkeley National Laboratory (LBNL) Studies, 2009, 2010, 2013, and 2014

Nationwide

The 2009 LBNL study included analysis of 7,489 sales within 10 miles of 11 wind farms and 125 post-construction sales within 1 mile of a wind turbine. The study used rural settings and wind farms of more than 50 turbines, and considered area stigma, scenic vista sigma, and nuisance stigma in varying distances from a wind turbine. The 2010 LBNL study included 7,500 single-family residential sales located in nine states and proximate to 24 wind farms, and 4,937 post-construction sales within 10 miles of a wind turbine. The 2013 LBNL study included 51,276 sales located in nine states and proximate to 67 wind farms, and 376 post-construction sales within 1 mile of a wind turbine. The 2014 LBNL study included over 50,000 sales located in nine states and proximate to 67 wind farms, and 1,198 post-construction sales within 1 mile of a wind turbine. All were located in rural settings and near wind farms of more than 0.5 megawatts. Theses study concentrated on nuisance stigma in varying distances from a wind turbine. The study found no statistically significant evidence that turbines affect sale prices. Neither study found statistical evidence that home values near turbines were affected.

University of Rhode Island, 2013

Rhode Island

Structured similarly to the LBNL studies, this study included 48,554 total sales proximate to 10 wind farms, and 412 post-construction sales within 1 mile of a turbine. These wind farms were mostly small facilities in urban settings. The study included nuisance and scenic vista stigmas. Page 421 of the report stated, "Both the whole sample analysis and the repeat sales analysis indicate that houses within a half mile had essentially no price change ..." after the turbines were erected.

The University of Guelph, Melancthon Township, 2013

Ontario, Canada

This study analyzed two wind farms in the township, using 5,414 total sales and 18 post-construction sales within 1 kilometer of a wind turbine. The study included nuisance and scenic vista stigmas. Page 365 of the study stated that "These results do not corroborate the concerns regarding potential negative impacts of turbines on property values."

University of Connecticut/LBNL, 2014

Massachusetts

This study included 312,677 total sales proximate to 26 wind farms, and 1,503 post-construction sales within 1 mile of a wind turbine. These wind farms were located in urban settings and primarily were proximate to small wind farms. The study included wind turbines and other environmental amenities/disamenities (including beaches and open spaces/landfills, prisons, highways, major road, and transmission lines) together, for nuisance stigma. "Although the study found the effects from a variety of negative features ... and positive features ... the study found no net effects due to the arrival of turbines."

Wichita State University, 2019

Kansas

This study strived to decipher and develop a better understanding of wind projects and their effect on rural properties in Kansas. The study's data is based on 23 operational wind projects in Kansas which came online between 2005 to 2015. The properties and their values, which were appraised at the county level, have sale dates ranging from 2002 to 2018. The study and its results suggest that property values do not spike once the project is completed. Rather, it was noted that they have a more "modest" growth, and that the three-year average for property value growth was 0.3% after a project had been completed and operational.

These studies had a combined number of over 3,700 transactions within 1 mile of operating turbines and found no evidence of value impact. [12]

[12] *Although I have read these studies, the substance of these summaries were taken from a seminar conducted by the Appraisal Institute on March 5, 2015.*

Conclusions

As a result of the market impact analysis undertaken, I concluded that there is no market data indicating the project will have a negative impact on either rural residential or agricultural property values in the surrounding area. Further, market data from Illinois, as well as from other states, supports the conclusion that the project will not have a negative impact on rural residential or agricultural property values in the surrounding area. Finally, for agricultural properties that host turbines, the additional income from the wind lease may increase the value and marketability of those properties. These conclusions are based on the following:

- There are significant financial benefits to the local economy and to the local taxing bodies from the development of the wind farm;
- The proposed wind farm will create well-paid jobs in the area which will benefit overall market demand;
- An analysis of recent residential sales proximate to existing wind farms did not support any finding that proximity to a wind turbine had a negative impact on property values;
- An analysis of agricultural land values in Illinois did not support any finding that agricultural land values are negatively impacted by the proximity to wind turbines;
- Reports from Illinois, South Dakota, Iowa, Minnesota, Kansas, and Indiana indicate that wind turbine leases add value to agricultural land; and
- A survey of County Assessors in 18 Illinois counties, 5 Indiana Counties, 21 Kansas counties, 8 South Dakota counties, 26 Iowa counties, 8 Minnesota counties, and 3 Ohio counties in which wind farms with more than 25 turbines are located determined that there was no market evidence to support a negative impact upon residential property values as a result of the development of and the proximity to a wind farm and that there were no reductions in assessed valuation.

This report is based on market conditions proposed as of July 15, 2019. This market impact study has been prepared specifically for the use of the client and to support the development of the Lincoln Land Wind, in Morgan County, Illinois. Any other use or user of this report is considered to be unintended.

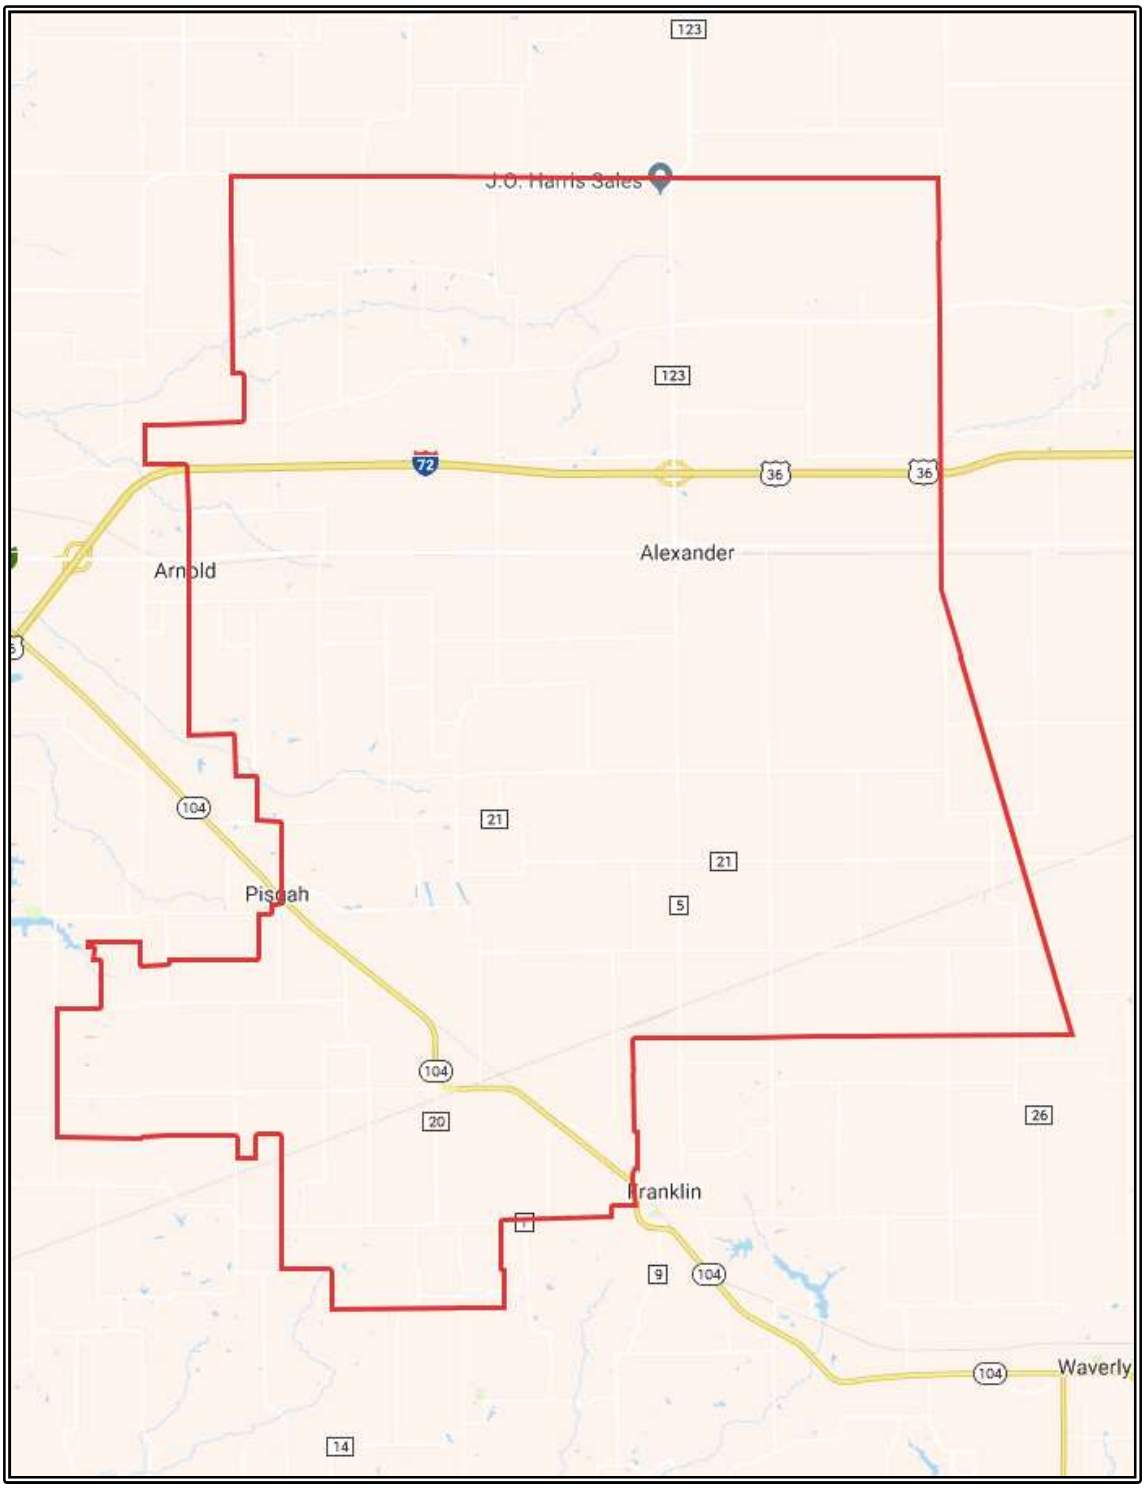
CERTIFICATE OF REPORT

I do hereby certify that:



1. The statements of fact contained in this report are true and correct;
2. The reported analyses, opinions, and conclusions are limited only by the reported assumptions and limiting conditions and are my personal, impartial, and unbiased professional analyses, opinions, conclusions, and recommendations:
3. I have no present or prospective personal interest in the property that is the subject of this report and no personal interest with respect to the parties involved;
4. I have performed no services, as an appraiser or in any other capacity, regarding the property that is the subject of this report within the three-year period immediately preceding acceptance of this assignment;
5. I have no bias with respect to the property that is the subject of the work under review or to the parties involved with this assignment;
6. My engagement in this assignment was not contingent upon developing or reporting predetermined results;
7. My compensation for completing this assignment is not contingent upon the development or reporting of predetermined value or direction in value that favors the cause of the client, the amount of the value opinion, the attainment of a stipulated result, or the occurrence of a subsequent event directly related to the intended use of this appraisal consulting assignment;
9. My analyses, opinions, and conclusions were developed, and this report has been prepared in conformity with the *Uniform Standards of Professional Appraisal Practice;*
10. I have made a personal inspection of the subject of the work under review;
11. Joseph M. MaRous provided significant appraisal review assistance to the person signing this certification;
12. The reported analysis, opinions, and conclusions were developed, and this report has been prepared, in conformity with the Code of Professional Ethics and Standards of Professional Appraisal Practice of the Appraisal Foundation;
12. The use of the report is subject to the requirements of the Appraisal Institute relating to review by its duly authorized representatives; and
13. As of the date of this report, Michael S. MaRous, MAI, CRE, has completed the continuing education requirements for Designated Members of the Appraisal Institute.

Illinois County Assessor Survey Analysis

A survey of assessors in 18 counties in Illinois which wind farms currently are operational has been undertaken. The supervisors or deputy supervisors of assessments were interviewed. The interviews were intended to allow the assessment officials to share their experiences regarding the impact of the wind farm(s) upon the market values and/or the assessed values of surrounding properties. The interviews were conversational, but thoroughly discussed residential and agricultural values and impacts. The interviews were conducted on October 2016.

Conclusions of the Study

Based on these interviews:

- Without exception, the interviewees reported that there was no market evidence to support a negative impact upon residential property values as a result of the development of, and the proximity to, a wind farm facility. In some counties, this results from the very rural nature of the area in which the projects are located.
- There have been no successful tax appeals in any county based upon wind farm-related concerns.
- In the past 18 months, the assessor's offices have not experienced a real estate tax appeal based upon wind farm-related concerns. As of the date of this report, there are more than 46 wind farms with 2,348 wind turbines and more than 1,000,000 properties situated within these counties. There have been no reductions in assessed valuations related to wind turbines.
- Residential assessed values have fluctuated consistently countywide as influenced by market conditions, with no regard for proximity to a wind farm.
- Agricultural properties are taxed based upon a productivity formula that is not impacted by market data and by external influences.

Scope of Project

The supervisors or deputy supervisors of assessments were interviewed. Each of the interviewees was familiar with the wind farm(s) located within their respective county. The following is the list of County Supervisors of Assessments contacted:

1. Stephenson County	Ronald A. Kane	815-235-8260
2. DeKalb County	Robin L. Brunschon	815-895-7120
3. Lee County	Wendy Ryerson	815-288-4483
4. Henry County	Lindi M. Kernan	309-937-3570
5. Bureau County	Thomas Sweeney	815-875-6478
6. LaSalle County	Stephanie R. Kennedy	815-434-8233
7. Grundy County	Thomas R. Hougas	815-941-3269
8. Stark County	Renee Johnson	309-286-7172
9. Marshall County	Patricia Heath	309-246-2350
10. Woodford County	Mary Bell	309-467-3708
11. Livingston County	Shelly Renkin	815-844-7214
12. Tazewell County	Gary Twist	309-477-2275
13. McLean County	Robert T. Kahman	309-888-5131
14. Ford County	Patricia Langland	217-379-9430
15. Iroquois County	Robert Yergler	815-432-6978
16. Logan County	Denise Martinek	217-732-9635
17. Champaign County	Paula Bates	217-384-3762
18. Vermillion County	Yvonne Robinson (Deputy)	217-554-1940

A map indicating the number of wind farms in each of these counties is included in this memorandum. A second map illustrates the number of the wind farms located in each of these counties.

Residential Market Values

Without exception, the interviewees reported that there was no market evidence to support a negative impact upon residential property values as a result of the development of and the proximity to a wind farm facility. Either as a request by a county board, in an attempt to appropriately assess newly constructed residences, or to support current assessed values, the supervisors of assessments have been particularly attentive to market activity in the area of the wind farms.

Iroquois County Supervisor of Assessments, Mr. Robert Yergler, is a real estate appraiser who has done extensive work in Livingston County. He reports that in addition to the existence of little data to suggest an impact in Iroquois County, he has not found any evidence to support adjustments for proximity to turbines in his private work.

Mr. Robert T. Kahman, the McLean County Supervisor of Assessments, conducted a survey in early 2017 in response to a board member's concerns. The research reported "an explosion" of sales in 2016 due to improving market conditions overall.

Bureau County Supervisor of Assessments Mr. Thomas Sweeney was asked by the county board to prepare an analysis to determine the impact upon market values of residential properties as a result of the development of wind farms within the county. Mr. Sweeney was able to find three properties and to study their successive sales, both before and after the development of the wind farm. His findings included:

- Property #1 sold for significantly less than the previous sale. The property owner was adamantly opposed to the development of the wind farm. The seller no longer had a use or interest in owning the property after the development of the wind farm and sold it. Mr. Sweeney considered the sale price to be a statistical outlier that was heavily influenced by the conditions of sale.
- Property #2 sold for "a little more" than its previous sale before the development of the wind farm.
- Property #3 sold for more in the later sale than in the earlier sale, but for less than the assessor's opinion of market value.

The findings were reported to the county board. The conclusion of the assessor and the county board was that, based upon the limited amount of market data available, there was no evidence of diminution in property values due to the wind farm.

In determining the assessed values of two residences constructed near the Rail Splitter wind farm, the Logan County Supervisor of Assessments Ms. Denise Martinek, studied the sales of nine residential properties in the area. Exclusive of one property, the sale prices "stayed the same, or actually increased" in the later sales than in the earlier sales of the same properties. The exception, the residence that sold for less, was a foreclosure property in its later sale.

Former Ford County Supervisor of Assessments, Ms. Candice D. Short, previously reported "no complaints" and "haven't had any appeals" from residential property owners. Additionally, Ms. Short reported that, since the completion of the Pioneer Trail wind farm, the sale prices of residences in the surrounding area have sold above the assessor's opinion of market value.

The former Champaign County Assessor, Mr. Stan Jenkins, reported that his office "has no evidence that the wind farms have had an impact on surrounding property values, positively or negatively". His successor indicated that nothing has changed since her arrival in April 2016.

Mr. Jenkins and Ms. Martinek stated that discussions among Illinois county assessors have indicated a general agreement that there is no proof that the wind farms have any impact upon property value.

Residential Assessed Values, Complaints/Tax Appeal Filings

The assessors reported that there have been no tax appeal filings based upon wind farm issues.[13]

Ms. Patricia Langland, who replaced Ms. Short in Ford County, reported no tax appeals but several inquiries from property owners as to when they would get their rebates from the energy companies. This apparently was triggered by such payments being made in a nearby county.

Ms. Renee Johnson, Stark County Supervisor of Assessments, reported that the owner of a residence in the area of the Camp Grove wind farm had complained of the wind farm noise but did not file a tax appeal. Subsequently, the property sold in excess of the assessor's opinion of market value.

McLean County Supervisor of Assessments, Mr. Robert T. Kahman, previously reported that property owners have come to his office presenting newspaper articles that claimed a negative impact upon property values due to wind farms. The articles are not accepted as evidence, but rather the property owners are invited to collect their own market data that support their claim of a diminution in value. Thus far, no property owners have submitted market data that contradict the data collected by the assessor's office.

Mr. Kahman reported expecting complaints and/or tax appeal filings in regard to the wind turbine constructed on the Heartland Community College campus. No complaints or tax appeal filings have been submitted regarding the college's wind turbine. Both single-family and multifamily properties are located within 1,900 feet of the wind turbine. The following aerial photograph depicts the location of the Heartland Community College campus, its wind turbine, and the neighboring residential development.

Agricultural Values/Assessed Values

The assessed values of agricultural properties are established based upon a productivity formula and are not driven by market data. Reportedly, assessed values of agricultural properties have been steady or increasing in recent years and are projected to continue increasing for the near future. The assessors reported that no major complaints have been received and/or no tax appeal filings have been filed for agricultural properties within the wind farm project area.

Based on this survey, it does not appear that the Supervisors of Assessments in the 18 counties surveyed in Illinois have reason to believe that the location of wind turbines in their county has had a negative impact on property values.

[13] A previously reported tax appeal in Vermilion County was not actually filed. A law suit by that property owner (Hartke) was apparently filed in 2013 against the Supervisor of Assessments in Vermilion County; however, the Assessor's office reports that there has been no further action on the matter.

Consistently, the assessors reported that whatever initial concern there may have been regarding property values during the planning and approval stages of the various wind farms dissipated once the wind farm was constructed. Repeatedly, where initially there had been community opposition to the development of a wind farm, the resultant facility is no longer perceived as having a negative influence upon property values. According to former LaSalle County Assessor Ms. Linda Kendall, "initially, there had been consternation regarding the development of wind farms and the potential impact upon property values. The impact is no longer a concern". The public perception of a negative impact upon property values due to wind farms constructed as early as 2003 had not materialized, and the assessors have reported an absence of tax appeal filings based upon wind farm-related issues.

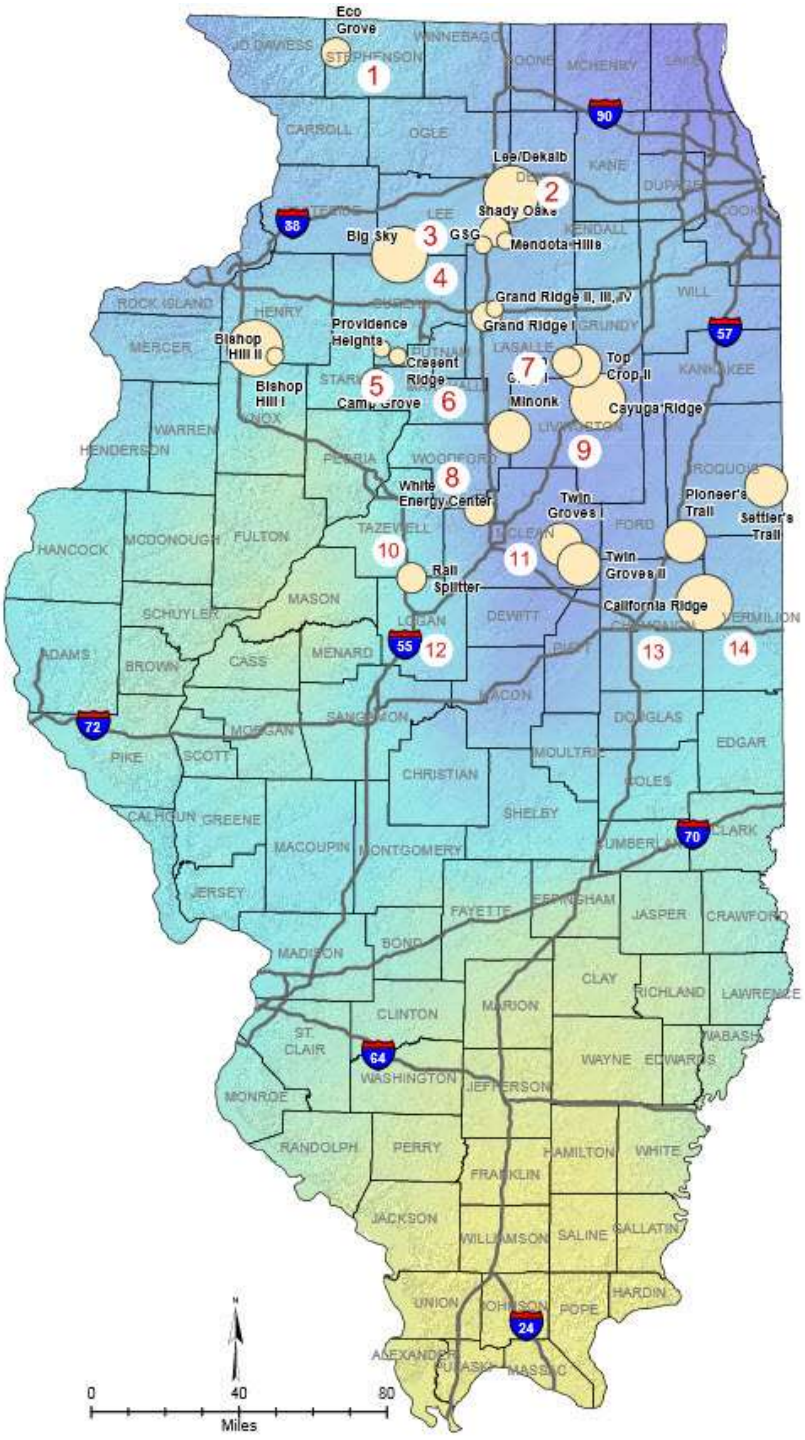
Agricultural Values/Assessed Values

he assessed values of agricultural properties are established based upon a productivity formula and are not driven by market data. Reportedly, assessed values of agricultural properties have increased by 10% annually in recent years and are projected to continue increasing at that rate for the near future. The assessors reported that no complaints have been received and/or no tax appeal filings have been filed for agricultural properties within the wind farm project area.

New Residential Construction

Several assessors reported new residential development in the area of wind farms. The Lee County Supervisor of Assessments Ms. Wendy Ryerson reported that a subdivision of 11 improved residential lots was developed prior to the construction of the wind farm, and the lot sales and construction of the residences occurred after the announcement of the development of the wind farm.

There were several reports of construction of scattered large acreage farmhouse residences in the area of wind farm properties. The McLean County Assessor reported the construction of a 4,821-square-foot single-family residence in the area of Arrowsmith, Illinois. The residence, at 8144 North 3100 East Road, is located 1,113 feet from a wind turbine on an adjacent property. The residential building and surrounding site improvements including a swimming pool have an assessor's opinion of market value of $878,467. The following photograph and aerial photograph depict the residence and the nearby wind turbine(s).



Based on this survey, it does not appear that the Supervisors of Assessments in any of the counties in Illinois have reason to believe that the location of wind turbines in their county has had a negative impact on property values.

Map of Illinois Counties Surveyed

Wind Farm Count by County

Note: As depicted on this map, as of the date of this survey, the locations of certain wind farms are approximations. In some instances, the wind farms are incorrectly shown to be located in adjacent counties. This map also shows the locations of smaller wind farms, but for the accuracy of this study we have only focused on the farms with 25 turbines or higher.

MICHAEL S. MAROUS
STATEMENT OF QUALIFICATIONS

Michael S. MaRous, MAI, CRE, is president and owner of MaRous and Company. He has appraised more than $15 billion worth of primarily investment-grade real estate in more than 25 states. In addition to providing documented appraisals, he has served as an expert witness in litigation proceedings for many law firms; financial institutions; corporations; builders and developers; architects; local, state, county, and federal governments and agencies; and school districts in the Chicago metropolitan area. His experience in partial interest, condemnation, damage impact, easement (including aerial and subsurface), marital dissolutions, bankruptcy proceedings, and other valuation issues is extensive. He has provided highest and best use, marketability, and feasibility studies for a variety of properties. Many of the largest redevelopment areas and public projects, including Interstate 355, the Chicago O'Hare International Airport expansion, the Chicago Midway International Airport expansion, and the McCormick Place expansion, are part of Mr. MaRous' experience. Mr. MaRous also has experience in regard to mediation and arbitration proceedings. Also, he has purchased and developed real estate for his own account.

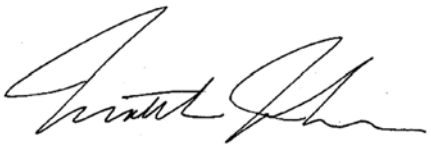
BARR

December 18, 2019

Permit Officer, Morgan County, IL
300 West State Street
Jacksonville, IL 62650

Re: Lincoln Land Wind Project – GE2.8-127, GE3.0-140, Nordex N149 and Vestas V150 Foundation Design Certification



To Whom It May Concern:

Barr Engineering Company (Barr) will complete calculations and construction documents for the wind turbine foundations to be constructed at the Lincoln Land Wind Project located in Morgan County, Illinois. Foundation design for the selected wind turbine model(s) will be completed based on a site specific geotechnical investigation, wind turbine manufacturer requirements, and standards of the wind industry.

Foundation loads are to be provided by turbine manufacturer and will be based on a Mechanical Loads Analysis Report (MLA) for the site climatic conditions. The design loads are proprietary to the turbine manufacturer thus no confirmation of this information can be made by Barr or is possible to independently confirm the turbine manufacturer supplied information.

Based on the design loads to be provided by the turbine manufacturer and the site specific geotechnical investigation, the foundation design will be completed in compliance with industry accepted professional standards for the local soil and climate conditions.

Sincerely,

Matthew B. Johnson, S.E.
Illinois License #081.006343

Appendix 16 – Emergency Action Plan

Premlinary Lincoln Land Wind Emergency Action Plan

Site Address

November

Prepared by

Manager of Health and Safety

Approved by

Facility Manager, Lincoln Land Wind

Regional Operations Manager

Introduction

Lincoln Land Wind recognizes that site personnel have the right and need to know the procedures to follow in the event of an emergency. With this policy, Lincoln Land Windintends to ensure the transmission of necessary information to site personnel regarding emergency action.

This Emergency Action Plan (“EAP”) is maintained to ensure the safety of all site personnel at Lincoln Land Windfacility in the event of a **major** emergency that could occur within our facility or at the fields in which we work. The EAP includes provisions for:

1. crisis management
2. medical emergency
3. building evacuation
4. building utility failure
5. fire
6. earthquake
7. adverse weather
8. hazardous material spill
9. crime / violent behavior / civil disturbance
10. bomb threat
11. turbine fire

The EAP is established to:

1. Identify alarm and emergency evacuation procedures.
2. Identify procedures to be followed by site personnel who remain to operate critical business operations before they evacuate.
3. Identify rescue and medical duties for all site personnel following emergency evacuation.
4. Identify persons who can be contacted for further information or explanation of duties under this plan.
5. Establish training guidelines for site personnel regarding this plan and what they need to know to protect themselves.

Responsibility

The responsibility for maintaining this EAP has been assigned to the Facility Manager.

Herein the term “Manager” or “Management” shall mean any Manager or Supervisor, unless otherwise specified.

Site Personnel Training

New site personnel will be oriented to the EAP via a copy and review of this document in combination with their orientation to other Lincoln Land Wind safety policies.

Beyond new hire orientation, the Facility Manager, or the persons direct supervisor shall be responsible for providing training

A copy of this EAP is provided to each site person and is always to be available for all site personnel to review.

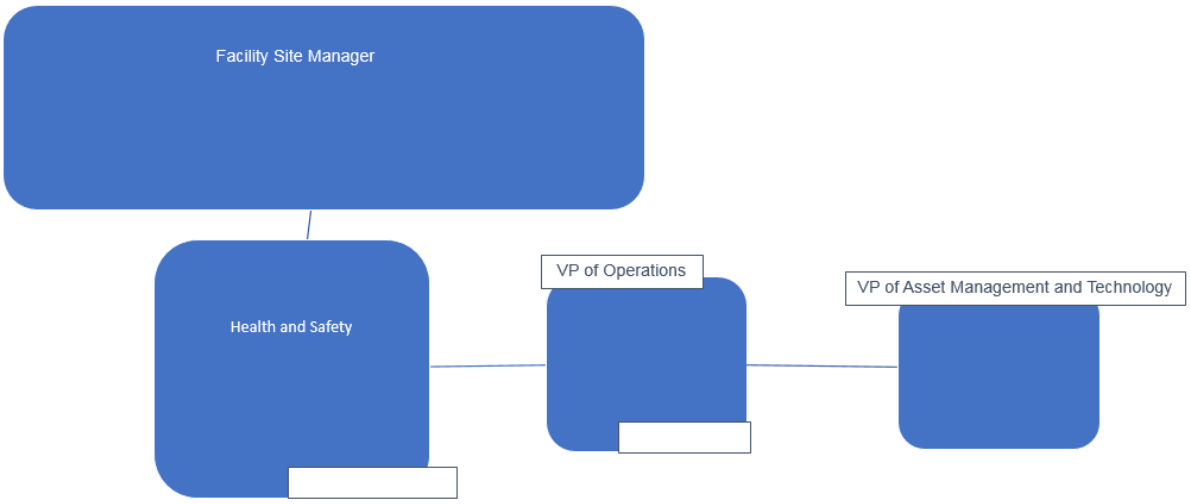
Emergency Organization Chart

EMERGENCY RESPONSE (ALL SITE PERSONNEL)			
First Aid/Survival	**Security**	**Maintenance**	**Communications**
• Evacuation • Emergency supplies • Injury assessment • First aid • Light search and rescue • Vehicles and other heavy equipment for rescue • Light firefighting • Site personnel shelter	• Security personnel to protect lives and property (e.g., equipment lock-up, sentry posting) • Signage, plywood and plastic sheeting, security ribbons, flares • Property damage assessment (physical threats; structural damage)	• Utilities control (building utilities shut-off; field high-voltage procedures) • Hazardous materials decontamination • Debris removal • Auxiliary power equipment	• Operate communications equipment (PA, phones, pagers, field radio) • Compile and relay disaster information as needed (site personnel roll call, injury lists) • Notify outside emergency services • Deploy messengers • Set up message board



MANAGEMENT GROUP		
Preparation	**Response in an Emergency**	**Business Recovery**
• Develops and maintains overall emergency plan and policies • Reviews recommendations for mitigative measures and training; makes necessary decisions; authorizes use of finances • Ensures site personnel training on policies and procedures • Maintains supply of emergency cash • Develops, maintains and distributes forms, maps, personnel assignment flowcharts, etc.	• Overall coordination and personnel deployment • Declares existence of an emergency based on status and damage assessment reports from teams • Authorizes evacuation when necessary • Interfaces with local utility companies • Interfaces with area Emergency Operation Centers regarding extent of disaster and availability of mass shelter • Responds to media and public inquiries	• Responsible for business recovery • Maintains documentation necessary to resume business • Determines value and estimates damages • Handles insurance claims • Handles loan applications • Interfaces with Lincoln Land WindUS corporate entities

Emergency Response Procedures

Corporate Emergency Response

In an event of a crisis or an emergency at the site, the Facility Manager will have support from the corporate office.

All Wind Farm Emergencies require a response from the corporate office with essential personnel. The essential staff identified includes the Safety Manager, a staff engineer, Operations Directors and possible public relations support. This team is to be used at the discretion of the Facility Manager. At any time during a crisis or an emergency, the Facility Manager can request additional support or stand down the responding essential corporate personnel. At the corporate level, all emergency responses will be operations driven managed by Vice President of Asset Management.

Emergency Communication Operations

ALL FIELD SITE PERSONNEL SHALL CARRY OR HAVE ACCESS TO COMMUNICATIONS MEDIA, AND IS IDENTIFIED BY HIS/HER SITE PERSONNEL NAME/NUMBER. SUBCONTRACTORS OFTEN CARRY THEIR OWN COMMUNICATIONS MEDIA AND ARE IDENTIFIED BY NAME.

COMMUNICATIONS MEDIA IS USED FOR COMMUNICATION BETWEEN THE SITE PERSONNEL IN THE FIELDS AND THE OFFICE PERSONNEL FOR THE PURPOSES OF:

- Field status reports
- Power outage coordination Emergency conditions
- Other daily work performance

IT IS ABSOLUTELY NECESSARY THAT EVERYONE HAVE COMMUNICATIONS MEDIA AT ALL TIMES DURING WORKING HOURS.

Power Outage Coordination

When communications media is being used to coordinate power outages for transformer maintenance or substation maintenance, you will need to know which fields are affected to call the appropriate offices for clearance of their field personnel.

Community Notification

In the event of an emergency, the Applicant's Remote Operations Control Center Operator (ROCCO) will assess each emergency to determine whether outreach to the community and adjacent landowners may potentially be required. The Director of Communications will notify municipal officials and landowners as appropriate. Additionally, the NYSDEC and/or NYSDPS will be contacted in the event of a spill, release, or similar facility-related emergency.

Field Injury

1. Confirm the severity of injury; are emergency personnel required?
2. Obtain an Accident Report Form and ask all the questions thereon of the caller. Fill out the form as you talk.
3. Confirm that someone from the field will meet emergency personnel at the appropriate rendezvous point.
4. Have the completed Accident Report in hand and contact 911 to relay the information.

Field Injury Procedure

A. FIRST PERSON AT THE ACCIDENT SCENE

Upon arriving at the scene of an injury related accident, the first person shall survey the scene (is it safe?), then notify management personnel of the following:

1. Severity of the victim(s) injury.
2. Emergency personnel “are” or “are not” required.

B. ACCIDENT REPORT

If emergency personnel are required, the management personnel shall:

1. Obtain an “Accident Report”
2. Copy information received via radio to the form.
3. Ensure that all areas of the form are completed.
4. Continue to monitor communications for further developments.

C. CALL 911

The designated 911-call person shall:

1. Dial 911 immediately.
2. Relay all the information on the accident form to the 911 operator.

D. NOTIFY THE FOLLOWING PERSONS

After the call to 911, the designated 911 call person shall notify all the following personnel (if possible):

1. Facility Manager
2. Health and Safety Manger
3. Regional Operations Manager
4. VP of Operations

Medical Emergency

Medical cases generally fall under the following categories:

1. **Minor Medical Case –** Medical cases requiring minimal lay car and presenting no disability potential. Frequently do not require professional medical care.
2. **Urgent Medical Case –** Medical cases that are not life threatening and not likely to result in permanent or serious disability. Require professional medical care.
3. **Emergency Medical Case –** Those medical cases that, if not properly attended to, could result in serious injury or death. Permanent disability is possible. Require professional medical care.

PROCEDURE

1. Do not move victim unless safety dictates.
2. Notify “base” of the extent of the medical emergency and your location.
3. See “Field Injury – Emergency Operations Procedure.”
4. If the injury appears to be life threatening, be prepared to give “base” as much information as possible so that they can relay the information to the professional (911) EMT’s.
5. See “Accident Report.”
6. If the injury is not life threatening or not likely to result in permanent disability, first aid care may be provided by a trained site personnel or the injured person will be transported to our industrial clinic by a supervisor.

LOCATION OF FIRST AID SUPPLIES

1. Office: Large first aid kit, fire extinguisher, AED
2. Each vehicle is equipped with an individual trauma kit and AED.

Building Evacuation

SITE PERSONNEL GUIDELINES

1. Building evacuation will occur upon instruction by Management personnel. Notification to building site personnel will be made the via radio, telephone and or intercom system.
2. Be aware of all marked exits from your area and building. Know the routes from your work area. Marked exit signs are installed in all buildings.

3. Take note of physically handicapped individuals in your area that may need assistance.
4. When instructed to evacuate, walk quickly to the nearest marked exit and ask others to do the same.
5. **DON'T:** Run, lag, scream, stop to get personal belongings, smoke, leave any doors open, or return to the building until you are instructed to do so.
6. All personnel should meet at:

SEE PAGE 38 FOR O&M BUILDING EVACUATION MAP

7. If it is safe, remain in this location until roll call has been taken by a Manager. Do not leave premises until accounted for and given permission to do so by Management. Valuable time could be wasted searching for personnel that have not followed correct procedures.
8. Keep fire lanes, hydrants and walkways clear for emergency crews and equipment.
9. During emergency, only personnel authorized by Management will be allowed in the building to perform such responsibilities as shutting down power, potentially hazardous equipment, heat sources, gases, machine and other electrical equipment.
10. Should you become trapped in a building, **DO NOT PANIC:**
    - If a window is available, place an article of clothing outside the window as a marker for rescue crews.
    - If there is no window, tap on the wall and shout at regular intervals to alert emergency crews.

Building Utility Failure

SITE PERSONNEL GUIDELINES

1. In the event of a major utility outage in an Lincoln Land Windbuilding during working hours, notify a member of Management.
2. If there is potential danger to the building occupants or if the utility failure occurs after hours, on the weekend, or a holiday, notify a member of Management.
3. Do not evacuate a building unless directed to do so by Management, the policy or fire department. Do not return to an evacuated building unless directed to do so by Management personnel.

Electrical / Light Failure

It is advisable to have a flashlight nearby for emergencies.

Plumbing Failure / Flooding / Water Leak

1. Cease using all electrical equipment.
2. Notify a Manager immediately.
3. Evacuate the immediate area to prevent injuries.

Natural Gas Leak

1. Cease all operations.
2. Notify a Manager immediately.
3. Evacuate the area immediately.

****DO NOT SWITCH LIGHTS ON / OFF OR UNPLUG ANY ELECTRICAL EQUIPMENT— ELECTRICAL ARCING COULD TRIGGER AN EXPLOSION.****

Ventilation Problems

1. If smoke or odors come from the ventilation system, immediately notify a Manager.
2. If necessary, cease all operations and vacate the area.

****DO NOT RETURN TO AN EVACUATED AREA UNLESS THE "ALL CLEAR" SIGN IS GIVEN BY A MANAGER.****

Fire

SITE PERSONNEL GUIDELINES

1. Field personnel should notify "O&M" to report the fire emergency. Someone at "base" will notify the Fire department. Office / Warehouse personnel should immediately dial "911" in the event of a fire. However, when in doubt, shout FIRE.
2. Know the location of fire extinguishers, fire exits, and alarm systems in your area and know how to use them. In most cases, do not attempt to extinguish the fire.
3. If a minor fire appears to be controllable, a Manager or a member of the Safety Committee may attempt to extinguish the fire using the fire extinguishers or other sources, such as water from a hose – only after "911" has been called.
4. A complete evacuation of the entire building or area will be performed in any fire emergency. All site personnel should proceed to the nearest exit. Last ones to exit should close doors behind them.
5. Seek out any handicapped personnel in the area and provide assistance when exiting.

6. Managers or site personnel will assist in the evacuation and will meet the Fire Department to direct them to the proper location. Once the Fire Department has arrived, the responding incident commander will take charge of all rescue operations and suppression activities.
7. Office / Warehouse should meet at:

TBD

8. Keep clear of fire lanes, hydrants, and walkways for emergency crews and vehicles.
9. Personnel should remain at this location until accounted for by Management. Do not leave premises until accounted for and given permission to do so. Valuable time could be wasted searching for personnel who have not followed correct procedures.
10. Only members of Management can declare the state of emergency over and give permission to re-enter.

Should you become trapped in a building during a fire:

- If a window is available, place an article of clothing (shirt, coat, etc.) outside the window for the rescue crews.
- If there is no window, stay near the floor where the air will be less toxic. Shout at regular intervals to alert emergency crews of your location. **DO NOT PANIC.**
- If the door is warm, do not open it. If smoke is entering the room through cracks around the door, stuff something in the cracks to slow the flow.

Turbine Fire

1. Dial 911
2. Notify Facility Manager
3. Verify turbine affected is isolated from the electrical system.
4. Determine fire location—base or nacelle—**and investigate with binoculars 100 feet from the turbine**
5. **Base Fires-** Advise emergency responders of hazards and give them control of the scene
6. **Nacelle Fires**- Establish a sterile zone (approximately 100ft) around the base of the turbine.
7. Keep **all** personnel away from the turbine (including emergency responders)
8. Allow fire debris to fall freely within controlled area.
9. Watch for fire debris to go beyond the controlled area.

10. Fire Department will manage the fire scene, site personnel will stand by to assist with isolation of additional turbines and electrical equipment if requested by the Fire Department Incident Commander.

Turbine Evacuation

SITE PERSONNEL GUIDELINES

Most turbine repair/maintenance activities are performed by teams of two employees/contractors. In the event dangerous conditions arise during turbine repair/maintenance activities (e.g., fire, thunderstorms other dangerous weather conditions), the affected employees/contractors will take the following steps:

1. Assessment/Immediate Response: The crews working at the turbine site will assess conditions, determine whether they pose an immediate safety threat, and initiate evacuation, if necessary.
2. Notification: use two-way radios, cell phones or other communications devices to inform the Facility Manager or designee of the situation and request guidance. If immediate evacuation is commenced without first consulting the Facility Manager or designee, initiate contact and apprise Facility Manager/designee of the situation once evacuation is completed.
3. Evacuation: Climb down the tower and/or evacuate the area.
4. Follow turbine manufacture emergency evacuation procedure

Assembly Areas: The appropriate assembly point differs depending on the nature of the emergency.

Field personnel should meet at:

TBD

Personnel Accounting: Personnel will contact the Facility Manager/designee and report whether everyone at the location has been accounted for.

Brush Fire

1. Dial 911
2. Notify Facility Manager
3. Advise all site employees of the fire emergency and gather team at the muster location.
4. Work with local responders to address fire encroachment near the facility or turbines

5. In the event firefighting teams utilize helicopter or fixed wing aircraft near wind farm the Fire Department Incident Commander may request to pause the turbines for safety.
6. Fire Department will manage the fire scene, site personnel will stand by to assist with isolation of additional turbines and electrical equipment if requested by the Fire Department Incident Commander.
7. All safety requests from the Incident Commander shall be followed by the site team.

Earthquake (Office / Warehouse)

GUIDELINES FOR OFFICE / WAREHOUSE / SHOP PERSONNEL

1. Stay in the building. Many injuries occur while people run through the building to the outside. It is possible to be hit by flying objects, falling plaster or other debris.
2. Assist any handicapped persons in the area and find a safe place for them.
3. Drop, cover, and hold. Try to take cover under a table or other sturdy furniture. Kneel, sit, or stay close to the floor. Hold onto furniture legs for balance. Be prepared to move with your cover. Face away from windows.
4. Doorways may not be the safest location for protection. Violent motion could cause doors to slam against your body, crush your fingers, or inflict other serious injuries. More importantly, you could become a target for flying objects.
5. You could kneel, sit, or stay close to the floor, next to a structurally sound interior wall. Place your hands on the floor for balance, as the ground may move violently for several minutes.
6. Try to avoid airborne objects. Move away from overhead fixtures, windows, bookcases, file cabinets, etc.
7. If you are outside, go to a clear area away from buildings, trees, and power lines.
8. Keep calm. Do not move. Wait for emergency instructions from Management.

IMMEDIATELY AFTER THE EARTHQUAKE

1. Be prepared for aftershocks. Although usually less intense than the main quake, they can cause further structural damage.
2. Gas leaks might be present. Do not use lanterns, torches, lighted cigarettes, or open flames.
3. Open windows, if possible, to ventilate the building. Watch out for broken glass.
4. If fire is caused by the earthquake, implement the fire procedures.

5. If evacuation is ordered:
    - Evacuate as instructed.
    - Provide assistance to any handicapped personnel.
    - Beware of falling debris and electrical wires as you exit.
    - Personnel should meet at:

TBD

6. If it is safe, remain in this location until accounted for by Management or Communications personnel. Do not leave premises until accounted for and given permission to do so. Valuable time could be wasted searching for personnel that have not followed correct procedures.
7. Keep fire lanes, hydrants, and walkways clear for emergency crews and equipment.
8. Only members of Management can declare the state of emergency over and give permission to re-enter.

Should you become trapped in building, DO NOT PANIC.

- If window is available, place an article of clothing outside the window as a marker for rescue crews.
- If there is no window, tap on the wall and shout at regular intervals to alert emergency crews.

LOCATION OF FIRST AID SUPPLIES

Shop and within our work trucks

Earthquake (Field) Guidelines for Field Site Personnel

DURING AN EARTHQUAKE

1. Move to an open area away from turbine towers, power lines, and poles.
2. Get low to the ground and balance yourself. The ground may move violently for several minutes.
3. If there is no open area, seek available shelter (such as your vehicle) to avoid falling objects. Stay in your vehicle if electrical wires fall on it. Wait for professional help – wires may still be live, and you could be electrocuted if you stepped outside.

IMMEDIATELY AFTER THE EARTHQUAKE

1. Be prepared for aftershocks. Although usually less intense than the main quake, they can cause further damage.
2. Use any communication means necessary to notify your supervisor of your status and position.
3. If you feel safe in doing so, attempt to evacuate to your safe shelter location.

MAIN ENTRANCE OF WIND FARM

SEE PAGE 38 FOR SITE MAP

4. Remain at your designated safe shelter location until you have answered to a roll call by a Manager. Do not leave the premises until accounted for and given permission to do by a Manager. Valuable time could be wasted searching for personnel that have not followed correct procedures.
5. You may be directed to return to the Lincoln Land Windoffice location. This does not give you permission to go elsewhere.
6. Only members of Management can declare the state of emergency over and give permission to leave the designated rendezvous location or the Lincoln Land Windshelter area.

LOCATION OF FIRST AID SUPPLIES

Service trucks

Adverse Weather

SITE PERSONNEL GUIDELINES

A serious weather “watch” indicates that conditions for bad weather exist. During a “watch” status, maintain a normal routine. Management will monitor available information report. A “warning” is more serious. The following is a list of emergency situations, definitions of these conditions, and general emergency instructions which should be followed:

Severe Thunderstorms

Winds exceeding 55 miles per hour and heavy lightning and thunder. Lightning is the greatest danger during a severe thunderstorm.

Special Precautions

1. Remain indoors.
2. Stay away from open doors, windows, metal pipes, or electrical appliances.
3. Prepare for flash flooding and low water crossings.
4. Follow Management instructions.

Working in Adverse Weather: Lightning

In addition to the General Safety Policy and General Safety Rules of the IIPP, the following shall apply:

1. Morning safety meetings shall cover forecasted weather conditions for the day.
2. Lightning warnings shall reflect a fifty (50) mile radius as an initial advisement to technicians that a storm is in the area, and a thirty (30) mile radius will indicate an immediate weather stand down. Technicians will be required to immediately stop working and head to their vehicles until the storm passes.
3. Stand down directions will be clear. The message “STOP WORK- weather stand down is in effect” shall be communicated when a storm reaches a thirty (30) mile radius from the turbine.
4. Site supervision will confirm all employees are accounted for and down tower. At that time, they will be directed to return to the shop or stay in the field until the lightning passes.
5. Lines of communications shall include radios as a primary source.

This policy effects all locations and the procedures are consistent throughout each wind farm.

The seemingly random nature of thunderstorms cannot guarantee the individual or group absolute protection from lightning strikes, however, being aware of, and following lightning safety guidelines can greatly reduce the risk of injury or death

General Information

During late spring to the summer months, in certain parts of the country, thunderstorms are common. Because of this, all service technicians who work in these areas need to be aware of the possible lightning conditions that may occur on our wind turbine projects during these thunderstorms. Before, during, and after thunderstorms all affected site personnel need to be aware of what to do and where to report.

Safer Locations During Thunderstorms and Locations to Avoid

No place is absolutely safe from the lightning threat; however, some places are safer than others. Large enclosed structures (substantially constructed buildings) tend to be much safer than smaller or open structures. The risk of lightning injury depends on whether the structure incorporates lightning protection, construction materials used, and the size of the structure. Avoid contact with metal or conducting surfaces outside or inside the vehicle.

Generally speaking, if an individual can see lightning and/or hear thunder he/she is already at risk. Louder or more frequent thunder indicates that lightning activity is approaching and increasing. If the time delay between seeing the flash (lightning) and hearing the bang (thunder) is less than 30 seconds, the individual should be in or seek a safer location. Be aware that this method of ranging has severe limitations in part due to the difficulty of associating the proper thunder to the corresponding flash.

High winds, rainfall, and cloud cover often act as precursors, to actual cloud-to-ground strikes by notifying individuals to take action. Many lightning casualties occur in the beginning, as the storm approaches, because people ignore the precursors. Also, many lightning casualties occur after the perceived threat has passed. Generally, the lightning threat diminishes with time after the last sound of thunder, but may persist for more than 30 minutes. When thunderstorms are in the area but not overhead, the lightning can exist even when it is sunny, not raining, or when clear sky is visible.

When available, pay attention to weather warning devises such as weather radio and/or credible lightning detection systems. However, do not let this information override good common sense as isolated storms are common.

Lightning Safety

Avoid being in or near:

Wind turbine and communications towers, other high places, open fields, isolated trees, light poles, metal fences, and open water (ocean, lakes, rivers, etc.). After the storm has passed, all site personnel shall wait at least one (1) hour before approaching any equipment. If you hear a hissing or crackling sound, this may be a sign of the wind turbine holding a charge. If these sounds are present, DO NOT TOUCH THE MACHINE.

When inside a building avoid use of the telephone, washing your hands, or any contact with conductive surfaces with exposure to the outside such as metal door or window frames, electrical wiring, telephone wiring, cable TV wiring, plumbing, etc.

When in vehicles during lightning you must not be touching any metallic objects referenced to the outside of the car. Door and window handles, radio dials, CB microphones, gearshifts, steering wheels, and other inside-to-outside metal objects should be left alone during close-in lightning events. If you are driving and get caught in a lightning storm, pull off to the side of the road in a safe manner (in a low area, not on a hill), turn on the emergency blinkers, turn off the engine, put your hands in your lap, and wait out the storm.

Heavy equipment like boom trucks, cranes, backhoes, bulldozers, loaders, graders, scrapers, mowers, etc. which employ an enclosed rollover systems canopy (ROPS) are safe in nearby electrical storms. The operator should shut down the equipment, close the doors, and sit with hands in lap, waiting out the storm. In no circumstances, during close-in lightning, should the operator attempt to step off the equipment to ground in an attempt to find another shelter. If operating a boom truck or crane, make sure to retract the boom and place in the boom rack.

****NOTE: EMERGENCY WORK CAN BE CONDUCTED IN THE SUBSTATION. ONLY QUALIFIED AND TRAINED PERSONNEL WILL BE ABLE TO CONDUCT WORK. A JSEA MUST BE COMPLETED AND RISK ASSESSMENT SHOULD REFLECT THE WEATHER AND ITS HAZARDS****

First Aid Recommendations for Lightning Victims

Most lightning victims can actually survive their encounter with lightning, especially with timely medical treatment. Individuals struck by lightning do not carry a charge and it is safe to touch them to render medical treatment. Follow these steps to try to save the life of a lightning victim:

1. **First:** Call 911 to provide directions and information about the likely number of victims.
2. **Response:** The priority of emergency care is “make no more casualties.” If the area where the victim is located is in a high-risk area (mountain top, isolated wind turbine, open field, etc.) with a continuing thunderstorm, the rescuers may be placing themselves in significant danger.
3. **Evacuation:** It is relatively unusual for victims who survive a lightning strike to have major fractures that would cause paralysis or major bleeding complications unless they have suffered a fall or been thrown a distance. As a result, in an active thunderstorm, the rescuer needs to choose whether evacuation from very high-risk areas to an area of lesser risk is warranted and should not be afraid to move the victim rapidly if necessary. Rescuers are cautioned to minimize their exposure to lightning as much as possible.
4. **Resuscitation:** If the victim is not breathing, start mouth-to-mouth resuscitation. If it is decided to move the victim, give a few quick breaths prior to moving them. Determine if the victim has a pulse by checking the pulse at the carotid artery (side of the neck) or femoral artery (groin) for at least 20 – 30 seconds. If no pulse is detected, start cardiac

compressions as well. In situations that are cold and wet, putting a protective layer between the victim and the ground may decrease the hypothermia that the victim suffers which can further complicate the resuscitation.

Location

TBD
Facility Manager:

Designated Muster Point: O&M Building conference room S

SEE PAGE 38 FOR SITE MAP

Backup Designated Muster Point: OM parking lot near entrance sign

Note: The persons named above shall be trained in the procedures to follow and have full authority to perform said duties. Training shall be performed annually or when the plan changes. A copy of this plan shall be available to all site personnel. The location manage shall maintain the master copy of this plan and forward a copy to the corporate Safety Officer. A map of any evacuation routes shall be posted and kept up to date by the plan supervisor.

Flooding

Concerns of the Office / Warehouse

1. Top off any underground tanks. Make tank access caps water tight, plug vents, and seal off pumping lines.
2. Plug all floor drains and sanitary lines.
3. If possible, disconnect electric motors and store in dry place.
4. Move chemicals to a high shelf.
5. If possible, put merchandise on pallets.
6. Shut off main power and valves.

Concerns of the Field

1. Down power lines.
2. De-energize substation.
3. Open KPF's.
4. Transformers down, exposing primary/secondary lines.
5. Cracks in dikes, exposing primary/secondary lines.
6. Control panels down, exposing secondary lines.
7. Towers over, exposing secondary lines.

Working in Adverse Weather: Tornadoes

General

In addition to the General Safety Policy and General Safety Rules of the IIPP, the following shall apply: This policy effects all locations that see annual weather situations. Although we have several types of wind turbines in these areas, the procedures are the same.

Definitions

Tornado Watch: A tornado watch means that conditions are favorable for tornados to develop.

Tornado Warning: A tornado warning means that either official spotters have sighted a tornado or Doppler Radar has reported a developing tornado. A tornado warning is typically issued for a small area (possibly a county or two) for less than an hour.

Fujita–Pearson Tornado Scale:

1. F-0: 40–72 mph, chimney damage, tree branches broken
2. F-1: 73–112 mph, mobile homes pushed off foundation or overturned
3. F-2: 113–157 mph, considerable damage, mobile homes demolished, trees uprooted
4. F-3: 158–205 mph, roofs and walls torn down, trains overturned, cars thrown
5. F-4: 207–260 mph, well-constructed walls leveled
6. F-5: 261–318 mph, homes lifted off foundation and carried considerable distances, autos thrown as far as 100 meters

General Information

During late spring to the summer months in certain parts of the country, tornados are commons. Because of this, all service technicians who work in these areas need to be aware of the possible tornado conditions that may occur on our wind turbine projects.

When a tornado is coming, you have only a short amount of time to make life-or-death decisions. Planning and quick response are the keys to surviving a tornado. Therefore, it is so important to conduct tornado drills before and during each tornado season.

1. When a tornado watch is issued in your area, stay tuned to a weather radio, commercial radio, and/or television to stay informed of changing weather conditions. Remain alert for approaching storms and remember that tornados can occur with little to no warning. Be prepared to take cover on short notice.
2. When a tornado warning is issued, local EMS will take, as a minimum, the following precautions to alert the public:
    - Sound local sirens (know what is the sequence in your area)
    - Activate the Emergency Alert System (EAS) to interrupt radio and television broadcasts to provide instructions and information to the public

Tornado Safety

Tornado danger signs (learn and know these tornado danger signs):

1. An approaching cloud of debris can mark the location of a tornado even if a funnel is not visible.
2. Before a tornado hits, the wind may die down and the air may become very still.
3. Tornadoes generally occur near the trailing edge of a thunderstorm. It is not uncommon to see clear, sunlit skies behind a tornado.

Take the following protective actions when a tornado watch has been issued in your area:

1. Have a person designated to monitor a radio or television
2. Notify all affected site personnel of the tornado watch and assure that they are in immediate contact if an emergency arises.
3. If the weather is extreme, remove all site personnel from the field and prepare for the safety of all site personnel.

Take the following protective actions when a tornado warning has been issued in your area:

1. Seek sturdy shelter in a basement or other predestinated “tornado shelter” (not a mobile home, car, or trailer)
2. Go at once to a windowless, interior room; storm cellar; basement; or lowest level of the building.
3. If there is no basement, go to an inner hallway or a small inner room without windows, such as a bathroom or closet.
4. Stay away from windows, doors, and outside walls (most deaths occur from flying debris)

If outdoors:

1. If possible, get inside a building.
2. If shelter is not available or there is no time to get indoors, lie in a ditch or a low-lying area or crouch near a strong building. Be aware of the potential for flooding.
3. Use arms to protect head and neck.

If in a car:

1. Never try to out drive a tornado in a car or truck. Tornadoes can change direction quickly and can lift a car or truck and toss it through the air.
2. Get out of the car immediately and take shelter in a nearby building.
3. If there is no time to get indoors, get out of the car and lie in a ditch or low-lying area away from the vehicle. Be aware of the potential for flooding.

After a tornado, be aware of your surroundings. Also:

1. Turn on radio or television to get the latest emergency information
2. Use the telephone only for emergency calls.
3. Watch for downed power and telephone lines (do not use the phone unless calling 911)
4. Around the projects watch for falling debris, exposed power lines, and chemical spills.
5. Give first aid when appropriate. Don't try to move the seriously injured unless they are in immediate danger of further injury.
6. Stay out of damaged buildings. Return only when authorities say it is safe.
7. Clean up spilled medicines, bleaches, gasoline, or other flammable liquids immediately. Leave the buildings if you smell gas or chemical fumes.

Location

Lincoln Land Wind -
Facility Manager: TBD

Designated Muster Point: TBD

Backup Designated Muster Point: OM parking lot near entrance sign

Note: The persons named above shall be trained in the procedures to follow and have full authority to perform said duties. Training shall be performed annually or when the plan changes. A copy of this plan shall be available to all site personnel. The location manage shall maintain the master copy of this plan and forward a copy to the corporate Safety Officer. A map of any evacuation routes shall be posted and kept up to date by the plan supervisor.

Cold Weather Safety

The purpose of this Safety Document is to provide the site personnel with the basic knowledge needed to work safely in conditions where the possibility of cold exists. At the end of this period of instruction the site personnel should:

- Be able to identify the conditions and circumstances that can lead to cold injury.
- Know the signs of cold injury.
- Explain the first aid treatment for cold injury.

The Cold Environment

The human body can experience a loss of functionality, damage, or death from the cold environment. Temperature is not the only factor resulting in cold injury. Immersion and wind speed can also contribute to the severity of cold injuries.

Immersion can cause a significant and rapid loss of body heat. In water temperatures that are well above freezing, a person can quickly become immobilized and drown.

Immersion Survival Times

Water Temperature Degrees Fahrenheit	30	40	50	60	70
Time for 50% Deaths	15 min	20 min	50 min	2 hrs.	Safe
Time for 100% Deaths	1 hr.	2 hrs.	4 hrs.	Some survive	Safe

In water temperatures as high as 60 degrees there is danger of people being overcome by the cold. Wind turbine sites are often located where there are lakes, rivers, creeks, or ponds. These are also areas where roads may become unstable. There is some chance of crashing into the water. Heavy rain can have the same effect as immersion. In the event a person should experience immersion the first step is to remove them from the cold, the second is to get them dry. As the need arises, use clothing to protect from getting wet.

Wind Chill

Just as exposure to wet and cold can rob heat faster than just temperature alone, so can strong winds. Strong winds enhance the effects of low temperatures. This chart shows combinations of wind and temperature that can lead to cold injuries. In areas where these conditions exist, care should be taken to cover all exposed flesh or stay out of the weather.

Wind Speed (MPH)	Perceived Temperature											
Calm	50	40	30	20	10	0	-10	-20	-30	-40	-50	-60
5	48	37	27	16	6	-5	-15	-26	-36	-47	-57	-68
10	40	28	16	4	-9	-21	-33	-46	-58	-70	-83	-95
15	36	22	9	-5	-18	-36	-45	-58	-72	-85	-99	-112
20	32	18	4	-10	-25	-39	-53	-67	-82	-96	-110	-121
25	30	16	0	-15	-29	-44	-59	-74	-88	-104	-118	-133
30	28	13	-2	-18	-33	-48	-63	-79	-94	-109	-125	-140
35	27	11	-4	-20	-35	-49	-67	-82	-98	-113	-129	-145
40	26	10	-6	-21	-37	-53	-69	-85	-100	-116	-132	-148

Little Danger if Properly Clothed
Danger of Freezing Exposed Flesh
Great Danger of Freezing Exposed Flesh

Cold Injuries

Hypothermia

The medical term for a drop in core body temperature is Hypothermia. As temperatures drop the human body adapts various strategies to keep the core temperatures at 98.6 degree Fahrenheit. “Goose bumps” and shivering are the first signs of a drop in body temperature. The body may restrict flow of blood to the extremities making them more susceptible to freezing. As the extremities get colder there is loss of coordination. As a person gets colder they become apathetic and lose gross motor functions. At some point shivering will cease. The skin will be cold and waxy, muscles will be rigid, and the heart rate slows. As the core temperature drops, the pupils dilate and the person will go into a coma. At a core body temperature below 86 degree Fahrenheit, there is a chance of cardiac arrest.

Local Cold Injury

Local cold injury is commonly called “frost bite”. Frost bite occurs when body tissue gets cold enough to freeze. It is most likely to affect the tips of the fingers, toes, ears, nose, cheek bones, and chin. While when first exposed to cold a body part will burn and sting, eventually as exposure time lengthens, there will be a loss of sensation. The skin may turn waxy grey or yellow. If the condition is allowed to continue, the tissue will freeze and cause permanent tissue damage.

Treatment

Prevention is always preferable to treatment. Heat is lost through the body by several means, not the least of which is radiation. It is important to cover all exposed areas of the body. Hands and head are often neglected when dressing for the cold environment. Head coverings should cover as much of the head, neck, and face as possible. Gloves should be insulated as should footwear. Clothes should be loose and layered. Clothing may need to be shed and donned several times during a work day. As one works, the clothes might need to be removed to keep from overheating. The clothes will need to be put on again during periods of inactivity.

Hypothermia

First priority in hypothermia / cold injury treatment is to remove the patient from the cold environment. Keep the person warm and dry. Use blankets, sleeping bags, etc. to cover exposed areas. Shelter the patient from the wind. If in the field, the cab of a vehicle with the heater running will provide a warm environment. If the patient is in advanced hypothermia (confused, no shivering) handle them gently and do not allow patient to exert themselves. There is possibility if cardiac arrest. Seek medical attention.

Local Cold Injury

In the event one suspects a local cold injury, remove the person from the cold. Never try to thaw any tissue if there is a possibility of it refreezing. Carefully remove any jewelry, wet or restrictive clothing. Leave the clothing if it frozen to the skin. Cover the skin with loose clothing or bandage to prevent friction or pressure. Never rub or massage the affected. If the area is hard and frozen, do not attempt to re- warm it by applying heat. Seek medical attention.

Hazardous Material

SITE PERSONNEL GUIDELINES

Safety Data Sheets (SDS's) are kept on premises on all chemicals we use.

These data sheets are located in: **O&M Warehouse**

For spills, leaks, and incidents when a fire is not involved, the following steps should be taken, if appropriate:

1. Do not make contact with the chemical. Evacuate all personnel in the area immediately. Seal off the area if possible to prevent further contamination of others until someone from Management arrives.
2. Seek out any handicapped personnel in the area and provide assistance when exiting.
3. Report the incident immediately to anyone in Management.
    - Type of incident. Are there any injuries?
    - Name and quantity of the material, if known.
    - Possible hazards to persons or the environment, if known.
    - Be sure to state if you feel that the spill or its vapors may cause an immediate threat to human life so that evacuation procedures may be implemented.
4. Anyone who is contaminated by the spill should avoid contact with others as much as possible. Washing-off contamination and first aid should be started immediately.
5. Do not try to contain or clean up spills. This will be conducted be someone designated by Management.
6. If it is safe, remain in this location until accounted for by roll call by Management. Do not leave premises until accounted for and given permission to do so. Valuable time could be wasted searching for personnel that have not followed correct procedures.
7. Keep fire lanes, hydrants, and walkways clear for emergency crews and equipment.
8. Only members of Management can declare the state of emergency over and give permission to re-enter.

Catastrophic Turbine Failure

SITE PERSONNEL GUIDELINES

- In the event of catastrophic turbine failure (blade failure, tower collapse) do the following:
- Call Facility Manager
- Stay away from the danger area
- Set up sterile zone and do not allow vehicles to park within fall down distance of any standing component
- Direct all media inquiries to the Facility Manager

Crime / Violent Behavior / Civil Disturbance

SITE PERSONNEL GUIDELINES

How to Report

You may contact any Manager or call “911” yourself to access the police department.

Reporting Crimes in Progress

If you are a victim or a witness to any in-progress criminal offense, report the incident as soon as possible, providing the following information:

1. Nature of the incident. MAKE SURE that the 911 dispatcher understands that the incident is IN PROGRESS!
2. Location of the incident.
3. A description of the suspect(s) involved.
4. A description of any weapons involved.
5. A description of any property involved.

Stay on the line with the dispatcher until a police officer arrives at the scene. Keep the dispatcher informed of any changes in the situation so that updated information cab be relayed to the responding units. Even if you are the victim and unable to communicate further, try to keep the line open.

Reporting Crimes Not in Progress

Even though it seems futile, all crime should be reported.

Be prepared to provide the following information to the investigating officer:

1. When the incident occurred.

2. If a property crime, what was taken or damaged.
3. The named and/or descriptions of any suspects or witnesses.

Civil Disturbance Response Plan

Any site personnel noting a possible civil disturbance should contact a Manager immediately. If necessary, all entrances and exits will be secured. Should unauthorized intruders gain access onto premises, refrain from any contact with the intruders. All site personnel should remain in the area, remain calm, and follow instructions from Management. Should intruders gain access into the building and damage property, site personnel should not interfere. The personal safety of our personnel is more important than the protection of our property.

Bomb Threat

SITE PERSONNEL GUIDELINES

All bomb threats must be treated as a serious matter and must be considered real until proven otherwise. The procedures described below should be implemented regardless of whether the bomb threat appears to be real or not.

Bomb Threats Through Mail or Suspicious Packages

1. Do not handle the envelope or package. Clear the area and call “911”. In addition, contact any manager.
2. The building will not be evacuated until Management personnel or local authorities have given orders to do so.

Bomb Threats Over the Phone

1. Keep the caller on the line as long as possible and try to obtain the following information:
    - When is the bomb going to explode?
    - Where is the bomb located?
    - What kind of bomb is it?
    - What does it look like?
    - Why did you place the bomb?
2. Also, try to record the following information:
    - Time of call
    - Age and sex of caller
    - Speech pattern, accent, possibly nationality, etc.
    - Emotional state of caller
    - Background noise
3. Immediately notify your supervisor or a Manager. Await further instructions. The building will not be evacuated until Management personnel or local authorities have given orders to do so.

Hurricane Procedure

1. Hurricane Procedure Policy

This plan is for all personnel working at the Lincoln Land Wind Farm.

It is our policy that safety of site personnel is the primary concern. Lincoln Land Windwill activate this procedure well before a hurricane reaches the project to assure the safety of site personnel.

2. Notification

In the event of an approaching Hurricane the following people must be notified;

Apex Safety Manager: Office Ph#:

Regional Operations Manager: Cell Ph#:

VP of Operations and Maintenance: Cell Ph#:

Apex ROCC: Office#

3. Hurricane Procedure

48 HOURS FROM LANDFALL: About two days before a hurricane is expected to affect your location, begin implementing the following actions.

- Review the hurricane emergency action plan with all involved personnel.
- Check building roofs. Make repairs to coverings and flashing as time allows.
- Remove all loose items from the roof, secure equipment doors and covers, and remove debris.
- Verify roof drains are clear of trash and other obstructions.
- Fill fuel tanks serving emergency generators and other vital services.
- Verify dewatering pumps are in service and working.
- Verify outside storm drains and catch basins are clean.
- Remove debris from outdoor areas that may become “missiles.”
- Remove loose, outdoor, inactive equipment.
- Back up computer data.

36 HOURS FROM LANDFALL: At 36 hours before anticipated landfall, time will be limited. Make sure you will have the staff needed to complete all of the following actions, and leave plenty of time to evacuate personnel.

- Protecting or relocating vital business records
- Removing all loose outdoor storage or equipment
- Anchoring portable buildings or trailers to the ground
- Securing outdoor storage or equipment that cannot be moved
- Installing manual protection systems (e.g. shutters, plywood covers and flood gates)
- Raising critical equipment off floors
- Moving critical equipment from basement and other below-ground areas
- Covering critical stock and equipment with waterproof tarpaulins
- Turning off fuel gas services
- Turning off non-essential electrical systems
- Verifying all fire protection systems are in service (e.g. water supplies, fire pumps, sprinklers, fire alarms and special extinguishing systems)
- Setting up flood barriers at all first-floor doors and entrances
- Temporarily closing buildings under construction to avoid entry of wind-driven rain

***24–32 HOURS BEFORE LANDFALL*: ALL PERSONNEL SHALL EVACUATE THE SITE**

***DURING THE HURRICANE*- Personnel shall remain off site. ROCC will operate the site remotely.**

***AFTER THE HURRICANE*-** Apex Facility Management will return to the site to conduct a safety assessment of the O&M building, warehouse, substation, and other critical components. When returning to the site, bring additional supplies and cameras to document conditions.

***AFTER THE HURRICANE HAZARD ASSESSMENT*-** If the site is deemed safe to return by the Apex Facility Manager, an ALL CLEAR will be issued and communicated to awaiting site personnel. Site personnel may return to the site once an ALL CLEAR is issued.

- Survey the site for hazards: Live electrical wires, broken glass and sharp metal, leaking fuel gases or flammable liquids, damaged building features or contents that could shift or collapse, Paved or hardscape areas undermined by wave action and subject to collapse, Flammable atmosphere in vapor space of flammable storage tanks, etc.

- Verify the status of protection systems. Check water supplies, fire pumps, automatic sprinklers, fire alarms and security systems.
- Manage impairment for protection systems: or Expedite repairs, Post fire watch in area with impaired fire protection, Post security personnel in areas where building or site access is not suitably controlled.
- Survey the damage and initiate repairs immediately: Promptly notify contractors to avoid waiting in line for service.
- Perform site wide inspection to determine if Turbine start up can be initiated.
- After confirmation site restoration can be established use SCADA to remote start turbines.
- Coordinate with site team to troubleshoot and repair turbines that were faulted and could not be restarted.

Establish repair priorities, including the building envelope, utilities and fire protection systems.

Document all damage by photograph for potential insurance claims. Work with Asset Manager to determine if Met Tower Data Logger download is required.

Operational Equipment Safety Protocols

Hurricanes

- Follow Hurricane Procedure
- Remote Operations Control Center (ROCC) to operate the site
- Conduct post hurricane inspection by management
- Report findings
- Return site to normal operations

Site Fire/ Turbine Fire

- Site management will control access to site to ensure the safety of all personnel and equipment
- Determine if de-energization is required
- Maintain communications with ROCC
- Conduct post fire inspection
- Return site to normal operations

Tornadoes

- Follow tornado procedure
- Remote Operations Control Center (ROCC) to operate the site
- Conduct post hurricane inspection by management
- Report findings
- Return site to normal operations

Substation Failure

- Site management will control access to site to ensure the safety of all personnel and equipment
- Determine if de-energization is required
- Maintain communications with ROCC
- Return site to normal operations

Adverse Weather Conditions

Icing

- Follow turbine manufactures icing procedure
- Determine whether work will stop or resume
- Conduct site assessment
- Determine if equipment can continue normal operations

High Winds

- SCADA will monitor
- 25mps will place turbine into pause (reference turbine manufacture wind speed specs)
- ROCC will monitor

Snow

- Conduct site assessment
- Determine if equipment can continue normal operations

High Ambient—*Per the generator resource summer preparation checklist*

- Review previous event issues and lesson learned applied
- Determine if coolant equipment is functional at the turbines Determine if coolant equipment is functional at the substation
- Determine if all transformer oil levels have checked and refilled as necessary
- Ensure that back-up generators have been tested for functionality (if applicable)

Low Ambient—*Per the generator resource winter preparation checklist*

- Review previous events issues and lessons learned applied
- Determine if equipment or exposed components need additional insulation
- Ensure all heaters in proper working order
- Determine if all cooling equipment has been disabled
- Determine if all transformer oil levels have checked and refilled as necessary
- Ensure that allback-up generators have been tested for functionality (if applicable)

Communications Loss

- Site management to remain on site and maintain turbine and substation control through communication reestablished
- Maintain communication with ROCC
- Report findings and repair communication issue

Pandemics

Pandemic Definition: An epidemic of infectious disease that is spreading through human populations across a large region

Examples Include: Small Pox, HIV, H1N1 Flu, Measles

Pandemics are declared when three conditions are met: 1) Emergence of an infectious disease to a new population, 2) the disease infects humans causing serious illness, 3) The disease is easily spread among humans

Pandemics may cause a serious reduction in workforce.

Preventative measures: washing hands, covering your mouth when sneezing, staying home from work to minimize further exposure

Pandemic Notification:

Health and Safety Manager: Office Ph#:

Regional Operations Manager: Cell Ph#: Report:

Exposure type:

- Influenza
- Measles
- Other

Contamination area:

- Isolate area
- Third party bio-hazard clean up

Worker exposure:

- Number of personnel
- Reduction in workforce
- Are there adequate available workers to ensure continued safety operations

Significant Impact to the operations:

- Operations will be relinquished to Apex Clean Energy's Remote Operations Center. The site will operated remotely until the all clear is given.

Water Shortage or Water Compromise

Extended water compromise or shortage more than 48 hours:

Site operations will be relinquished to Remote Operations Control Center. The site will be operated remotely until potable water is reestablished for site personnel.

Notification:

Health and Safety Manager:

Regional Operations Manager:

Appendix 17 – Drainage Plan

Lincoln Land Wind Farm

Drainage Repair and Remediation Plan

WHEREAS, Section VII.F. of Morgan County's Wind Energy Conversion Systems Siting Regulations Ordinance ("**Ordinance**") requires the Applicant (or WECS Permittee) seeking (or holding) a Siting Approval Permit for a Wind Energy Conversion System ("**Commercial Wind Energy Facility**") to submit a plan to the County for remediation and repair of agricultural drainage systems and field tiles damaged during construction, maintenance and/or operation of the Commercial Wind Energy Facility;

WHEREAS, Lincoln Land Wind, LLC has submitted an application to Morgan County seeking a Siting Approval Permit to construct and operate the Lincoln Land Commercial Wind Energy Facility;

THEREFORE, Lincoln Land Wind, LLC submits the following Drainage Repair and Remediation Plan to the Morgan County Engineer for review and approval pursuant to Section VII.F. of the Ordinance.

1. Definitions

All capitalized terms used in this Drainage Repair and Remediation Plan ("**Plan**") shall have the definition used for them in the Agricultural Impact Mitigation Agreement ("**AIMA**") entered into between Lincoln Land Wind, LLC ("**Lincoln Land**") and the Illinois Department of Agriculture on _____. Definitions of certain of those terms used in the Plan are provided below:

"**Best Efforts**" – Diligent, good faith, and commercially reasonable efforts to achieve a given objective or obligation.

"**Commercial Wind Energy Facility**" – A wind energy conversion facility of equal or greater than 500 kilowatts in total nameplate generating capacity.

"**Construction**" – The installation, preparation for installation and/or repair of a Commercial Wind Energy Facility.

"**Deconstruction**" – The removal of a Commercial Wind Energy Facility from the property of a Landowner and the restoration of that property as provided in the AIMA.

"**Department**" – The Illinois Department of Agriculture.

"**Landowner**" – Any person with an ownership interest in property that is used for agricultural purposes and that is a party to an Underlying Agreement.

"**Professional Engineer**" – An engineer licensed to practice engineering in the State

of Illinois, and who is determined to be qualified to perform the work described herein by mutual agreement of the County and the Commercial Wind Energy Facility Owner.

"**Soil and Water Conservation District**" – A local unit of government that provides technical and financial assistance to eligible landowners for the conservation of soil and water resources.

"**Underlying Agreement**" – The written agreement with a Landowner(s) including, but not limited to, an easement, option, lease, or license under the terms of which another person has constructed, constructs, or intends to construct a Commercial Wind Energy Facility on the property of the Landowner.

"**Underground Cable**" – Electrical power lines installed below grade to be utilized for conveyance of power from the wind turbine(s) to the wind facility substation.

2. Pre-Construction Activities

A. **Identify Tile Lines**.

(i) Lincoln Land will work with the Landowners to identify the tile lines traversing the property included within the Underlying Agreement.

(ii) To ensure all drainage tiles have been located, reasonable measures should be made to locate all existing tile in the vicinity of the private access roads by exploratory trench or other appropriate methods.

B. **Pre-Construction Plans**

(i) All tile lines identified pursuant to Section 2(a)(i) and (ii) will be shown on the Construction and Deconstruction site plans submitted to the County prior to Construction ("**Site Plans**"), and the locations of tile lines so identified shall be staked or flagged prior to Construction or Deconstruction to alert Construction and Deconstruction crews to the possible need for tile line repairs.

(ii) To the extent practicable, there will be a minimum of one foot of separation between the tile line and the Underground Cable whether the Underground Cable passes over or under a tile line, and such separation will be shown on the Site Plans.

3. Construction/Deconstruction Phase

A. **Tile Line Repair Standards**

(i) If underground drainage tile is damaged by Construction or

Deconstruction activities, it shall be repaired in a manner that assures the drainage tile's proper operation at the point of repair.

(ii) Where tile lines are severed by an excavation trench, repairs shall be made using the Department's Drain Tile Repairs, Figures 1 and 2. Copies of Figures 1 and 2 are attached hereto.

(iii) If the tile line was damaged as part of the excavation for installation of an Underground Cable, the Underground Cable will be installed with a minimum one foot clearance below or over the tile line to be repaired or otherwise to the extent practicable.

(iv) The original tile line alignment and gradient shall be maintained to the greatest extent possible. If the tile needs to be relocated, the installation angle may vary due to site specific conditions and Landowner recommendations. A laser transit shall be used to ensure the proper gradient is maintained. A laser operated tiling machine shall be used to install or replace tiling segments of 100 linear feet or more.

B. **Tile Line Repair Procedures**

(i) Lincoln Land will comply with the following procedures when repairing damages caused to drainage tiles:

(1) (a) record the date that the damage occurred, if observed by Lincoln Land, and the date the damage was reported, if reported by a Landowner; (b) record the Global Positioning Systems (GPS) coordinates of broken tile; (c) complete an inspection form indicating that the tile has been damaged; and (d) log the form.

(2) Take a "before" photograph of the broken tile.

(3) Make repairs to the tile using methods prescribed by this Plan (to be determined on a case by case basis).

(4) Take an "after" photograph of the repaired tile.

(5) Provide all photographs and forms to Lincoln Land's Operations and Maintenance facility.

(6) Upon request, information about the tile repair will be provided to the impacted Landowner and Morgan County.

C. **Tile Line Repair Process and Schedule**

(i) Tile lines that are damaged, cut, or removed shall be staked or flagged

with stakes or flags placed in such a manner they will remain visible until the permanent repairs are completed.

(ii) If water is flowing through any damaged tile line, Lincoln Land shall utilize Best Efforts to immediately, upon discovery or notification, repair the tile line in a temporary manner until such time as Lincoln Land can make permanent repairs.

(iii) All permanent tile line repairs must be made within 14 days of identification or notification of the damage; provided, however, if the tile lines are dry and water is not flowing, temporary repairs may be made if the permanent repairs cannot be completed within 14 days due to weather or soil conditions. As soon as practical, exposed tile lines will be screened or otherwise protected to prevent the entry of foreign materials or animals into the tile lines.

4. Post-Construction Phase

A. **Restoration and Tile Line Repair Obligations**

(i) Following Construction and/or Deconstruction activities, Lincoln Land will utilize best practices to restore the drainage in the area to the condition it was in before commencement of the Construction/Deconstruction activities.

(ii) Following completion of the work, Lincoln Land will be responsible for correcting all tile line repairs that fail due to Construction and/or Deconstruction activities, provided those repairs were made by Lincoln Land.

(iii) Notwithstanding Sections 4(A)(i) and (ii), for those Landowners that request to perform the tile line repairs themselves, Lincoln Land shall offer the Landowners the area commercial rate for their machinery and labor costs and Lincoln Land will not be responsible for such tile line repairs.

B. **Dispute Resolution**

(i) If the Landowner and Lincoln Land cannot agree upon a reasonable method of permanent tile line repair, Lincoln Land may – but is not required to – implement the recommendations of the Morgan County Soil and Water Conservation District and such implementation will be deemed to have resolved the dispute. If Lincoln Land chooses not to implement the recommendations of the Morgan County Soil and Water Conservation District, it shall engage a Professional Engineer acceptable to Landowner and at Lincoln Land's sole cost and expense to inspect the site and

recommend a method of repair in accordance with the specifications set forth in this Plan. The Professional Engineer's recommendation shall be binding on Lincoln Land and the Landowner, and shall be implemented by Lincoln Land.

C. **Final Site Plans**

(i) Lincoln Land shall update the Site Plans with any underground field drainage tiles encountered during construction and not previously included in the Site Plans.

(ii) Lincoln Land will provide such updated Site Plans to Morgan County at any time during construction upon reasonable request, and shall deliver to Morgan County the final Site Plans after completion of Construction. In addition, following completion of construction, Lincoln Land will provide all affected Landowners with a copy of the portion of updated Site Plans showing tile repairs on their property with GPS coordinates identified as the electric cable crosses said property.

(iii) After Construction, in accordance with the AIMA, Lincoln Land will provide the Department with "as built" drawings (strip maps) showing the location of all tile lines by survey station encountered during Construction so that the Department may distribute the drawings and GPS tile line repair coordinates to the Morgan County Soil and Water Conservation District for the purpose of assisting Landowners with future drainage needs.

Appendix 18 – Financial Assurance

DECOMMISSIONING BOND

BOND NUMBER _____

KNOW ALL MEN BY THESE PRESENTS, that _____, as Principal, and [_____], a [_____] duly organized under the laws of the State of [_____], as Surety, are held and firmly bound unto XXXXXXXX County, as Obligee, in the sum of $_____ lawful money of the United States, for payment of which, well and truly to be made, we bind ourselves, our heirs, executors, administrators, successors and assigns, jointly and severally, firmly by these presents, the liability of the Surety being limited to the penal sum of this bond regardless of the number of years the bond is in effect.

WHEREAS, pursuant to the _____ Ordinance (the "Ordinance") which Ordinance sets forth the terms and conditions which govern the development, construction and operation of wind energy facilities in _____, and which Ordinance is hereby specifically referred to and made part hereof, and

WHEREAS, the Ordinance requires the submission of a bond guaranteeing the removal of the wind power facility and its related structures and restoration of the surrounding soil and vegetation at the site of the wind power facility located at _____ (the "Facility") at the end of the Facility's useful life.

NOW THEREFORE, the condition of this obligation is such, that if the above bounden Principal shall perform in accordance with the aforesaid Resolution and indemnify the Obligee against all loss caused by Principal's breach of any ordinance or agreement relating to the removal or restoration of the Facility, then this obligation shall be void, otherwise to remain in full force and effect unless cancelled as set forth below.

Notwithstanding the provisions of the agreement, the term of this bond shall apply from _____ day of _____20[__] until ____ day of _____and may be extended by the Surety by a continuation certificate, however, neither nonrenewal by the Surety, nor the failure or inability of the Principal to file a replacement bond in the event of nonrenewal, shall itself constitute a loss to the Obligee recoverable under this bond or any renewal or continuation thereof.

THIS BOND may be cancelled by the Surety by giving thirty (30) days written notice by certified mail to the Obligee. Such cancellation shall not affect any liability the Surety may have or incurred under this bond prior to the effective date of the termination.

THIS BOND is signed, sealed, dated on the _____day of _____, _____.
This bond is effective the _____ day of _____, _____

ROAD MAINTENANCE SURETY BOND - 2B
BOND NO.:_____

KNOW ALL MEN BY THESE PRESENTS, that we, _____
_____
herein called "Principal" whether one or more, and ***_____
_____
a corporation duly authorized to do a surety business within the State of Florida, herein called "Surety", are held and firmly bound unto the County of Sarasota, a political subdivision of the State of Florida, hereinafter called "The County", for the use of said obligee and all persons supplying the Principal or his contractors or subcontractors, or some or any of them, with labor, services, materials and/or supplies used directly or indirectly in and about the construction of all road improvements required by the County of Sarasota under any ordinances and regulations thereof, for or in connection with the approval of the plat of that certain subdivision more particularly hereinafter described which improvements may consist of, but are not necessarily limited to, paving, curbing, grading, filling, storm sewers, sanitary sewers, water systems, catch basins, headwalls, pipe lines, or other similar improvements, whether specifically mentioned herein or not and whether particularly described by any attached schedules or not, in the full and just sum of_____
_____Dollars ($_____)
lawful money of the United States of America, said sum being twenty percent (20%) of the construction cost of the improvements as estimated by a Registered Florida Engineer, to be paid unto said County, its successors and assigns, to which payment, well and truly to be made we bind ourselves, our heirs, personal representatives, successors and assigns, jointly and severally, firmly by these presents.

WHEREAS, the Principal has applied to the County for approval of a construction plan for a certain road to be known as **_____
and has agreed as a condition to the approval of said plan by said County to maintain the improvements as shown on the Plans and Specifications approved by and on file with the County for a period of two (2) years after issuance of the FIRST LETTER.

WHEREAS, it is a further condition for the approval of said plan by said County that this bond should be furnished to the County.

NOW, THEREFORE, the condition of this obligation is such that if the Principal shall promptly repair and maintain all of said improvements to the original condition required by said County or any ordinances and regulations thereof, as amended, should the same because of defective materials, faulty engineering, faulty workmanship, weather or any other causes require such repair or replacement within two (2) years after final inspection and certification of completion (FIRST LETTER) of said improvements by the County then this obligation shall be void, otherwise remaining in full force and effect.

***[Insert name of Bonding Company and physical street address]**
****[Insert Subdivision name exactly as shown on the Plat]**

REVISED: 5/02

And the said Surety on this bond, for value received, hereby stipulates and agrees that no changes, extensions of time, alterations or additions to the work or to the plans, specifications and schedules covering the same, or in the term or mode of payment for the same, shall in anywise affect liability or payment under this bond, and it does hereby waive notice of any and all such changes, extensions of time, alterations and additions to the work or to the plans, specifications and schedules covering said work.

Whenever the Principal shall have failed or refused to repair or maintain the said work by the date hereinabove specified, or any subsequent extension date agreed to by the Principal and the County, the County may declare the Principal to be in default and the Surety may promptly remedy the default, or shall promptly:

1) Complete the said repair or maintenance work in accordance with the specifications and schedules covering said work and such approved additions, amendments or alterations as may be made in the plans, specifications and schedules covering said work, or

2) Obtain a bid or bids for submission to the County for completion of said work in accordance with the plans, specifications and schedules covering said work, and such approved additions, amendments or alterations as may be made in the plans, specifications and schedules for said work, and upon determination by the County and the Surety of the lowest responsible bidder, arrange for a contract between such bidder and the County, and pay to such bidder as work progresses (even should there be a default or a succession of defaults under the contract or contracts of completion arranged under this paragraph) the funds required to pay the cost of completion of said repair or maintenance work as herein described.

The County shall be entitled to its reasonable attorneys' fees and costs in any action at law or equity, including appellate court actions, to enforce the County's rights under this bond.

IN WITNESS WHEREOF, the Principal and Surety have caused these presents to be duly executed on the ____ day of _____, 20__.

Appendix 19 – Railroad Easement

WIRE CROSSING CONTRACT (KCS Contract No. _____)

THIS AGREEMENT, made and entered into this __ day of ___, 2018, by and between **THE KANSAS CITY SOUTHERN RAILWAY COMPANY,** a Missouri corporation, hereinafter referred to as "Railway Company", and Lincoln Land Wind, LLC, a Delaware limited liability company, to be addressed at c/o Apex Clean Energy, Inc., 310 4th Street NE, Suite 200, Charlottesville, VA 22902, hereinafter referred to as "Licensee".

WITNESSETH:

WHEREAS, Licensee desires to construct and maintain wires, hereinafter described, across the right-of-way and tracks of Railway Company and across the telephone, telegraph, signal and other wires of Railway Company and The Western Union Telegraph Company, the latter wires being hereinafter referred to as "Company wires";

NOW, THEREFORE, IT IS AGREED AS FOLLOWS:

1. **PERMIT FOR CROSSING:** For the sole convenience and accommodation of Licensee, at its sole risk and expense, and in consideration of the covenants of Licensee hereinafter set forth, Railway Company, without any warranty or guarantee of suitability of the premises for Licensee's or any other purpose, hereby permits Licensee to construct, maintain and operate a crossing (herein referred to as wire crossing), the course of the wire crossing being described as follows:

> ____ wire line crossing Railway Company right-of-way and tracks at Mile Post ___ (___ Subdivision), ___ (___ County), __, as indicated on print of drawing no. 18-___ dated __-__-2018, marked Exhibit "A", attached hereto and incorporated herein by reference.

The rights granted under this License are subject to all outstanding superior rights whether or not of record (including those in favor of licensees and lessees of Railroad's property, and others) and the right of Railway Company to renew and extend the same, and is made without covenant of title, or for quiet enjoyment. Railway Company does not warrant title and Licensee accepts the rights granted herein and shall make no claim against Railway Company for deficiency of title. Licensee acknowledges that the Railway Company's interest in the right-of-way varies from segment to segment and may include lesser interests than fee title. Licensee shall, at Licensee's sole cost and expense, obtain any and all necessary rights and consents from parties other than Railway Company which may have or claim any right, title or interest in the property upon which the Railway Company's right-of-way is located.

2. **SPECIFICATIONS:** Licensee's wire carrier crossing shall be encased in a __" x __' __ casing pipe having a minimum wall thickness of ___" and shall be placed at a depth of not less than __' below the base of the rail in the tracks of the Railway Company, nor less than a minimum of __' below the ditch and all other points upon the right of way. The Licensee shall safeguard its wire at the points where the same enter and leave said casing so as not to obstruct the right of way or endanger persons or trains or the passage of persons over said right of way. The Licensee shall protect its wire at the points where the same enters and leaves said casing, so as to afford no obstruction or risk to trains or the passage of persons over said right-of-way.

Locations of the wire crossing shall be marked and markers maintained and plainly visible at the right-of-way lines. Installation shall be by ____ method and no boring or excavation shall occur within Railway Company's right of way, nor shall any boring occur in the track embankment. The angle of the wire crossing beneath Railway Company's property and tracks shall be no less than __°.

3. Licensee shall not enter nor commence construction on or under Railway Company's property or right-of-way unless accompanied by a Railway Company qualified construction observer and flagger to oversee Licensee's

work on Railway Company's property or right-of-way. Licensee will be responsible for all construction observer, flagging and mobilization costs, herein referred to as "Services", and arranging for these necessary Services associated with the installation. To enable arrangements to oversee for these Services that are to be performed under this Agreement, Licensee must submit a written scheduling request to Railway Company's Scheduling Agent, hereinafter referred to as "Scheduling Agent", which request is received by the Scheduling Agent for approved Railway Company qualified construction observer and flagging contractor a minimum of thirty (30) Business Days in advance before Licensee proposes to commence work on or under Railway Company's property or right-of-way. (A "Business Day" is any day Monday through Friday which is neither a federal holiday nor a state holiday at the address of Railway Company's scheduling agent stated below.) The request must contain Licensee's name, the date of this Agreement, the location of the work to be performed, and how many consecutive Business Days will be required for Licensee to complete the work. Licensee's request must be delivered to Scheduling Agent by contacting Bartlett & West at 785-228-3101 to leave a message and/or by sending an email to kcscrossings@bartwest.com**.**

Licensee will, upon receipt of an invoice from Scheduling Agent specifying in reasonable detail Scheduling Agent's costs and expenses of providing these Services, reimburse Scheduling Agent for all of their costs and expenses of providing an inspection, flagging and mobilization prior to installation.

Railway Company's designation of a company or individual as a Railway Company "qualified" flagger or flagger provider, or Scheduling Agent, shall be construed solely as Railway Company's willingness to allow said individual or entity to provide Services on Railway Company's property or right-of-way without further proof of qualification, and shall not be construed as an endorsement or other verification of the abilities or qualifications of said Scheduling Agent by Railway Company. All flaggers or Scheduling Agents provided herein shall be treated solely as independent contractors of Licensee, with no relationship to Railway Company, for all purposes herein. Licensee and its agents, employees and contractors will clear the tracks when directed to do so by the flagger. The presence of the flagger will not relieve Licensee of its duty to keep all of its agents, employees and contractors clear of the tracks when trains are in dangerous proximity to the licensed area. The actions or inactions of the flagger shall be construed for all purposes herein as the actions or inactions of the Licensee, and shall be governed by Licensee's duties of indemnification, and saving harmless under Section 3 of this Agreement.

If Licensee's scheduling request fails to reach Scheduling Agent at least thirty (30) Business Days before Licensee's proposed commencement of work, Railway Company may refuse to allow commencement of the work on the Licensee's proposed commencement date. If Railway Company will not allow the work to proceed on Licensee's proposed commencement date because the scheduling request did not reach Scheduling Agent in time, Railway Company will inform Licensee of this fact as promptly as possible and work with Licensee to arrange an alternative commencement date for the work.

The construction observer and flagger will remain at the site on a reasonably continuous basis to oversee the work, and charges will accrue for each day spent awaiting the completion of the work and the installation of appropriate signs marking where Licensee's facilities enter and leave Railway Company's property and right-of-way. If installation takes longer than contracted for with Scheduling Agent, Licensee will, upon receipt of an invoice from Scheduling Agent specifying in reasonable detail Scheduling Agent's costs and expenses of providing the inspection, flagging and mobilization, reimburse Scheduling Agent for all of Scheduling Agent's costs and expenses of providing an inspector, flagger and mobilization.

Once Licensee has submitted its scheduling request to Scheduling Agent, should Licensee require a change to the scheduled date, Licensee shall provide Scheduling Agent at least two (2) Business Days' notice prior to the requested start date of the work. If Licensee fails to provide two (2) Business Days' notice of the change, Licensee

shall be charged, and agrees to pay, the daily rate, and any travel costs actually incurred, for the construction observer, flagging and mobilization for one (1) day.

4. **POLES:** Licensee shall not erect or cause to be erected any poles, anchors or guy wires upon the right-of-way of Railway Company except as indicated upon the attached Exhibit A, and which poles, anchors and guy wires shall not be placed nearer than twelve (12) feet from the nearest rail of any main track or nearer than nine (9) feet from the nearest rail of any side track.

5. **ADOPT MODERN METHODS:** Licensee shall, at all times, at its own expense, adopt and maintain the most effective system and use the best known and most effective methods approved by Railway Company to protect the property of Railway Company, including Company wires, from interference and physical hazard.

6. **MAINTENANCE:** Licensee shall maintain the wire crossing to conform to the requirements of Section 2 hereof, and shall make frequent inspections of the crossing for that purpose. If it shall come to the attention of Railway Company that the same is not being so maintained, Licensee will, on written request of Railway Company, at any time, promptly make such renewals or repairs in wire crossing as shall be designated by Railway Company, and if Licensee fails within ten (10) days to comply with such request, Railway Company may make such renewals and repairs, the cost of which Licensee agrees to pay, or Railway Company may, at its option, wholly remove the crossing wires, and the supporting structures, conduits and appurtenances from the right-of-way.

7. **ADDITIONAL WIRES OF LICENSEE** In the event Licensee desires to install additional wires at the crossing in the locations hereinbefore described on the same poles, or towers, or in the same conduits, hereinbefore provided for, Licensee shall first obtain Railway Company's written consent for the construction or installation of such additional wires.

8. **CHANGES HEREAFTER MADE BY RAILWAY COMPANY:** If at any time during the term of this Agreement, it shall become necessary for Railway Company to build additional track or tracks, depots, yards, or any other structure that may be necessary in connection with the operation and maintenance of Railway Company, or to change the grade or location of its track or tracks, or if changes in or additions to Company wires or poles used in connection therewith shall become necessary, or if it shall become necessary to do any work to comply with the requirements of Railway Company, or with the demands which may hereafter by law be prescribed with reference to the crossing, Licensee shall, at its own cost and expense, within thirty (30) days after receipt of written notice from Railway Company so to do, relocate, rearrange, reconstruct or revise the wire crossing in such manner as to conform to the requirements of Railway Company.

9. **CONSIDERATION, INDEMNITY: IN CONSIDERATION OF THE LICENSE AND PERMISSION HEREIN GRANTED, LICENSEE ASSUMES AND AGREES TO INDEMNIFY, SAVE AND HOLD HARMLESS RAILWAY COMPANY, ITS OFFICERS, EMPLOYEES, SERVANTS, AGENTS, REPRESENTATIVES, AND OTHER COMPANIES OPERATING TRAINS OVER ITS TRACKS FROM ANY CLAIMS OR DEMANDS (WHETHER ARISING IN OR BASED UPON TORT, CONTRACT, STRICT LIABILITY, OR OTHERWISE) (INCLUDING LEGAL FEES AND COURT COSTS) MADE BY ANY AND ALL PERSONS FOR ACCIDENTS, INJURIES OR LOSSES ARISING FROM OR GROWING OUT OF THE PRESENCE, USE OR OPERATION OF LICENSEE'S POLES, TOWERS, WIRES AND APPURTENANCES ON RAILWAY COMPANY'S RIGHT-OF-WAY, OR FROM THE ESCAPE OF CURRENT THEREFROM, OR FROM THE BREACH OF ANY OF THE TERMS OR CONDITIONS OF THIS AGREEMENT BY LICENSEE, AND FROM ANY PAYMENTS WHICH RAILWAY COMPANY AND OTHER COMPANIES, OR ANY OF THEM, MAY MAKE TO ITS OR THEIR EMPLOYEES AND THEIR BENEFICIARIES, OR ANY OF THEM UNDER THE PROVISIONS OF ANY COMPENSATION LAW OR OTHER SIMILAR LAW OR UNDER THE PROVISIONS OF ANY PLAN FOR EMPLOYEES' BENEFITS ADOPTED BY RAILWAY COMPANY AND OTHER COMPANIES, OR ANY OF THEM, IN**

SAMPLE

SETTLEMENT FOR ACCIDENTS OR INJURIES ARISING FROM OR GROWING OUT OF THE FAILURE OF LICENSEE TO CONSTRUCT AND MAINTAIN THE WIRE CROSSING AS HEREIN PROVIDED. LICENSEE SHALL INDEMNIFY, SAVE AND HOLD HARMLESS THE AFOREMENTIONED COMPANIES AS PROVIDED IN THIS SECTION UNLESS SUCH LOSS ARISES OUT OF THE SOLE NEGLIGENCE OF THOSE COMPANIES.

LICENSEE RECOGNIZES THE DANGER INCIDENT TO THE OPERATION OF TRAINS OVER THE TRACKS OF RAILWAY COMPANY IN THE VICINITY OF THE WIRE CROSSING, AND AGREES TO ADOPT AND ENFORCE UPON ITS EMPLOYEES ENGAGED IN CONSTRUCTING, RECONSTRUCTING OR MAINTAINING THE WIRE CROSSING PROPER RULES AND REGULATIONS FOR THEIR SAFETY WHILE ON OR NEAR SUCH TRACKS, AND LICENSEE ASSUMES ALL LIABILITY FOR INJURIES TO ALL PERSONS ENGAGED IN SUCH WORK AND AGREES TO INDEMNIFY, SAVE AND HOLD HARMLESS RAILWAY COMPANY, ITS OFFICERS, EMPLOYEES, SERVANTS, AGENTS, REPRESENTATIVES AND OTHER COMPANIES OPERATING TRAINS OVER ITS TRACKS FROM ANY LIABILITY FOR SUCH INJURIES EXCEPT WHEN THE SAME IS CAUSED BY THE SOLE NEGLIGENCE OF RAILWAY COMPANY OR SUCH OTHER COMPANIES, ITS OR THEIR EMPLOYEES.

LICENSEE AGREES TO REIMBURSE AND PAY RAILWAY COMPANY, OR SUCH OTHER COMPANIES, ANY JUDGMENTS, COSTS, AND EXPENSES OR AMOUNTS PAID OUT IN SETTLEMENT, WHICH THEY OR ANY OF THEM MAY BE PUT TO OR MAY BE COMPELLED TO PAY ON ACCOUNT OF ANY CLAIMS ARISING UNDER LICENSEE'S DUTIES OF INDEMNIFICATION, SAVING AND HOLDING HARMLESS. THIS AGREEMENT IS MADE IN PART FOR THE BENEFIT OF OTHER COMPANIES OPERATING OVER RAILWAY COMPANY'S TRACKS AND ANY OF THE COMPANIES MAY SUE TO ENFORCE THE PROVISIONS HEREOF, EITHER JOINTLY OR SEVERALLY, AS THEIR INTERESTS MAY BE JOINT OR SEVERAL. NONE OF THE COMPANIES SHALL BE LIABLE FOR ANY DAMAGE (EXCEPT THAT WILLFULLY DONE) TO THE WIRE CROSSING, HOWEVER CAUSED.

It shall be the exclusive duty and responsibility of Licensee to inspect the property subject to this Agreement to make sure that it is safe for the entry of its employees, agents and contractors. Licensee shall advise all of its employees, agents and contractors entering the property of any safety hazards on the property, including, without limitation, the presence of moving vehicles, buried cables, tripping hazards and overhead wires. Licensee shall instruct all of its employees, agents and contractors entering the property that all persons, equipment and supplies must maintain a distance of at least twenty-five (25) feet from the centerline of the track unless authorized by the on-site railroad flagman to be closer than twenty-five (25) feet. Licensee shall ensure that no personnel, equipment or supplies under its control are within the clearance point of the track when moving railroad equipment may be seen from or heard at the property subject to this Agreement.

10. **OTHERS NOT TO USE:** Licensee shall have no right to permit others to install wires in the crossing, but if done, then the obligations, duties and liabilities herein imposed upon Licensee shall be the same as to such wires, as though they were the wires of Licensee, and Railway Company shall retain all remedies against Licensee for breach of this Agreement.

11. **FEES:** Licensee agrees to pay to Railway Company for the use of Railway Company's right-of-way and the privilege hereby granted, such use and privilege being expressly limited to the facilities described in Section 1 above, the one-time sum of ____ AND NO/100 DOLLARS ($__.00) upon execution of this Agreement. Licensee shall pay Railway Company an additional license fee, set in accordance with Railway Company's then current fee schedule, for any additional pipelines, wires or facilities permitted by Railway Company and associated with the crossing.

12. **TAXES:** Licensee shall promptly pay all taxes, assessments and other governmental or municipal charges upon its property located upon the right-of-way of Railway Company and comply with all governmental or municipal rules and regulations covering the operation of electrical transmission lines of the character constructed, erected or operated hereunder.

13. **TERM:** The term of this Agreement shall be for a period of forty-tw0 (42) years, beginning on the date first written above, and will automatically renew at the end of the initial forty-two (42) year term for additional one (1) year periods until cancelled by either party upon thirty (30) days advance notice.

This Agreement shall continue so long as the wire crossing does not materially interfere with the property or the development, enlargement or improvement of the property of Railway Company, or in the reasonable opinion of the Chief Engineer of Railway Company, the wire crossing does not constitute a hazard to Railway Company's property or employees.

Neither the service of the notice herein provided for, nor the termination of this Agreement shall operate in any manner whatsoever to relieve or release Licensee from any obligations or liability to Railway Company theretofore accruing under the terms hereof.

Upon the termination of this Agreement in any manner Licensee shall immediately remove its property from the right-of-way, and in the event of its failure so to do, Railway Company may remove the same at the cost of Licensee.

Rights herein granted are personal and may not be assigned without Railway Company's written consent. However, the provisions of this Agreement shall be binding upon the successors and assigns of both of the parties.

14. **INTERFERENCE:** If the operation or maintenance of the wire crossing shall at any time cause interference, including, but not limited to, physical interference from electromagnetic induction, electrostatic induction, or from stray or other currents with the facilities of Railway Company or of any lessee or licensee of Railway Company, or in any manner interferes with the operation, maintenance or use by Railway Company of its right-of-way, tracks, structures, pole lines, signal and communication lines, radio or other equipment, devices, other property or appurtenances thereto, Licensee agrees immediately to make such changes in its own lines and furnish such protective devices to Railway Company and its lessees or licensees as shall be necessary in the reasonable judgment of Railway Company's representative to eliminate such interference. The cost of such protective equipment and its installation shall be borne solely by Licensee.

In the event that the methods above set forth fail to eliminate such interference, and it is deemed reasonably necessary by the proper officer of Railway Company having jurisdiction therein that any or all facilities of Railway Company or of any lessee or licensee thereof shall be relocated, reconstructed or otherwise changed, the entire cost of such changes shall be borne by Licensee.

The current due to electrostatic effects shall not exceed 5.0 milliamperes, rms, to ground. In the event it is determined that such current, at any time, exceeds 5.0 milliamperes, rms, Railway Company shall have the right to require such installation or modification as may be necessary to reduce the current to 5.0 milliamperes, rms, or less, and the entire cost of the installation or modification shall be borne by Licensee.

15. **ENVIRONMENTAL CLAUSE:** Licensee shall not permit hazardous waste, hazardous substances or hazardous materials on or in the area covered by this Agreement without the written consent of Railway Company.

Licensee shall at all times keep the area covered by this Agreement in a safe, clean and sanitary condition, and shall not mutilate, damage, misuse, alter or permit waste therein. Should any discharge, leakage, spillage or

SAMPLE

emission of any hazardous waste, hazardous substance or hazardous material or pollution of any kind occur upon, in, into, under or from the area covered by this Agreement during Licensee's use and occupancy thereof, Licensee, at its sole cost and expense, shall clean all property affected thereby, to the satisfaction of Railway Company and any governmental body having jurisdiction thereover.

Licensee shall comply with all applicable ordinances, rules, regulations, requirements and laws whatsoever including (by way of illustration only and not by way of limitation) any governmental authority or court controlling environmental standards and conditions on the premises and shall furnish satisfactory evidence of such compliance upon request by Railway Company. **IF, AS A RESULT OF LICENSEE'S OPERATION HEREUNDER, ANY SUCH ORDINANCE, RULE, REGULATION, REQUIREMENT, DECREE, CONSENT DECREE, JUDGMENT, PERMIT OR LAW IS VIOLATED, OR IF, AS A RESULT OF ANY ACTION BY LICENSEE, ANY HAZARDOUS OR TOXIC WASTE, MATERIALS OR SUBSTANCES SHOULD ENTER OR OTHERWISE AFFECT ANY PART OF THE AREA COVERED BY THIS AGREEMENT (INCLUDING SURFACE, SUBSURFACE, AIRBORNE AND/OR GROUND CONTAMINATION), LICENSEE SHALL INDEMNIFY, SAVE AND HOLD HARMLESS RAILWAY COMPANY, ITS OFFICERS, EMPLOYEES, SERVANTS AGENTS, AND REPRESENTATIVES FROM AND AGAINST ANY PENALTIES, FINES, COSTS, RESPONSE, REMEDIAL, REMOVAL AND CLEAN-UP COSTS, CORRECTIVE ACTION, NATURAL RESOURCE DAMAGE AND DAMAGES AND EXPENSES OF ANY OTHER NATURE WHATSOEVER, INCLUDING LEGAL FEES AND COURT COSTS, IMPOSED UPON OR INCURRED BY RAILWAY COMPANY, CAUSED BY, RESULTING FROM OR IN CONNECTION WITH SUCH VIOLATION OR VIOLATIONS.**

FOR THE PURPOSES OF THIS ENVIRONMENTAL SECTION, LICENSEE AGREES TO INDEMNIFY, SAVE AND HOLD HARMLESS RAILWAY COMPANY, ITS OFFICERS, EMPLOYEES, SERVANTS AGENTS AND REPRESENTATIVES FROM AND AGAINST ANY AND ALL CLAIMS, DEMANDS, ACTIONS, LIABILITY, RESPONSIBILITY AND CAUSES OF ACTION (WHETHER ARISING IN OR OUT OF TORT, CONTRACT, STRICT LIABILITY, OR OTHERWISE) ASSERTED AGAINST THEM FOR DEATH, INJURY, LOSS OR DAMAGE RESULTING TO RAILWAY COMPANY'S EMPLOYEES OR PROPERTY, OR TO LICENSEE OR LICENSEE'S EMPLOYEES OR PROPERTY, OR TO ANY OTHER PERSONS OR THEIR PROPERTY, AND FOR ALL PENALTIES, FINES, COSTS, RESPONSE, REMOVAL, REMEDIAL AND CLEAN UP COSTS, CORRECTIVE ACTION, NATURAL RESOURCE DAMAGE AND DAMAGES AND EXPENSES OF ANY OTHER NATURE WHATSOEVER, INCLUDING LEGAL FEES AND COURT COSTS, ARISING FROM, RELATED TO OR HAPPENING IN CONNECTION WITH THE BREACH OF THE DUTIES, OBLIGATIONS AND RESPONSIBILITIES OF LICENSEE AND ITS AGENTS, REPRESENTATIVES, SERVANTS, EMPLOYEES, CONTRACTORS AND REPRESENTATIVES UNDER SECTION 15 OF THIS AGREEMENT.

FOR THE PURPOSES OF THIS ENVIRONMENTAL SECTION, LICENSEE FURTHER AGREES THAT ITS OBLIGATIONS OF INDEMNITY, SAVING AND HOLDING HARMLESS HEREUNDER PURSUANT TO THIS SECTION SHALL BE STRICT AND ABSOLUTE, AND SHALL REMAIN IN FULL FORCE AND EFFECT IRRESPECTIVE OF ANY NEGLIGENCE ON THE PART OF RAILWAY COMPANY.

16. **REQUIRED INSURANCE:** So long as this Agreement is in effect Licensee agrees to maintain comprehensive general liability, and contractual liability insurance with minimum limits of two million dollars ($2,000,000.00) per occurrence, four million dollars ($4,000,000.00) aggregate. Licensee shall provide automobile liability coverage in the amount of one million dollars ($1,000,000.00) combined single limit. In addition, Licensee shall provide or require minimum statutory worker's compensation coverage for all covered employees who are on Railway Company’s property. Licensee must also provide Railroad Protective Liability

Insurance naming the Railway Company as the Insured with coverage of at least two million dollars ($2,000,000.00) per occurrence and six million dollars ($6,000,000.00) aggregate. Each policy must be issued by financially reputable insurers licensed to do business in all jurisdictions where work is performed during the term of the Agreement. A certificate of insurance will be provided to Railway Company by Licensee, reasonably satisfactory in form and content, evidencing that all required coverage is in force and have been endorsed to provide that no policy will be canceled or materially altered without first giving the Railway Company thirty (30) day's prior written notice. Commercial general liability policy will name Railway Company as an additional insured and, to the fullest extent allowed under law, will contain a waiver of subrogation in favor of Railway Company. All policies will be primary to any insurance or self-insurance the Railway Company may maintain for acts or omissions of Licensee or anyone for whom Licensee is responsible. Licensee will include copies of relevant endorsements or policy provisions with the required certificate of insurance. Nothing contained in this Section limits Licensee's liability to the Railway Company to the limits of insurance certified or carried by Licensee. If Licensee utilizes subcontractors in performance of this Agreement, the subcontractors must meet the same insurance requirements as the Licensee. If a subcontractor does not meet the coverage requirements of this Section, subcontractor must either supplement the deficient areas of coverage or Licensee must certify that Licensee has acquired sufficient coverage to supplement the deficiency of subcontractor.

17. **EEO REQUIREMENT**. THE PARTIES HEREBY INCORPORATE THE REQUIREMENTS OF 41 CFR §§ 60-1.4(A), 60-300.5(A), AND 60-741.5(A) AND 29 CFR SECTION PART 471, APPENDIX A TO SUBPART A, IF APPLICABLE. THESE REGULATIONS PROHIBIT DISCRIMINATION AGAINST QUALIFIED INDIVIDUALS BASED ON THEIR STATUS AS PROTECTED VETERANS OR INDIVIDUALS WITH DISABILITIES, AND PROHIBIT DISCRIMINATION AGAINST ALL INDIVIDUALS BASED ON THEIR RACE, COLOR, RELIGION, SEX, OR NATIONAL ORIGIN. MOREOVER, THESE REGULATIONS REQUIRE THAT COVERED PARTIES TAKE AFFIRMATIVE ACTION TO EMPLOY AND ADVANCE IN EMPLOYMENT INDIVIDUALS WITHOUT REGARD TO RACE, COLOR, RELIGION, SEX, NATIONAL ORIGIN, PROTECTED VETERAN STATUS, OR DISABILITY.

IN WITNESS WHEREOF, the parties hereto have caused this Agreement to be executed in duplicate by their authorized representatives as of the date first above written.

RETURN TO

MEMORANDUM OF AGREEMENT

THIS MEMORANDUM OF AGREEMENT (this "Memorandum") is made and entered into as of February 26, 2018 (the "Effective Date"), by and between Robert A. Spradlin, a single person ("Lessor") and LINCOLN LAND WIND, LLC, a Delaware limited liability company ("Lessee").

1. Property. Lessor and Lessee have entered into a Lease and Easement Agreement for Wind Energy Project (the "Agreement") dated as of the Effective Date, for certain real property located in Morgan County, Illinois, as more particularly described on Exhibit A attached hereto (the "Property"), which Agreement grants to Lessee certain Leasehold and easement rights.

2. Term. The Agreement is for an initial development period of up to seven (7) years, and if the terms and conditions of the Agreement are met, the Agreement shall continue for a construction term and an operation term of up to thirty-five (35) years.

3. Grant of Rights. The Agreement grants Lessee an exclusive leasehold interest in the Property, and grants to Lessee the Operation Easements, all as more specifically set forth in the Agreement. Lessor has leased the Property to Lessee on the terms and provisions set forth in the Agreement. The Agreement is for the use of the Property solely for wind energy purposes, and provides Lessee with the exclusive right to use the Property for wind energy purposes

4. Legal Description. Lessor and Lessee have agreed that under certain circumstances at any time after a legal description of the Property is prepared by a surveyor certified under the laws of Illinois has been completed, Lessee may, at its sole option, unilaterally execute and record an amendment to Exhibit A to set forth the final legal description of the Property. No consent or authorization from Lessor shall be required for such amendment to be effective.

5. Incorporation of Agreement. This Memorandum is for informational purposes only and nothing contained herein shall be deemed to in any way modify or otherwise affect any of the terms and conditions of the Agreement, the terms of which are incorporated herein by reference. This instrument is merely a memorandum of the Agreement and is subject to all of the terms, provisions and conditions of the

Agreement. In the event of any inconsistency between the terms of the Agreement and this instrument, the terms of the Agreement shall prevail.

6. Non-Interference and Setbacks. To the extent permitted by law Lessor has waived any and all setbacks and setback requirements, whether imposed by applicable law or by any person or entity, including without limitation any setback requirements described in any Morgan County Ordinances, or in any governmental entitlement or permit heretofore or hereafter issued to Lessee. Lessor has agreed not to engage in any activity that might cause a decrease in the output or efficiency of the Improvements.

7. Binding Effect. The rights and obligations set forth herein shall be binding upon and inure to the benefit of the parties hereto and their respective heirs, personal representatives, successors and assigns.

8. Recording. This Memorandum is executed for the purpose of recordation in the Official Records of Morgan County, Illinois, in order to establish record notice of the existence of the Agreement and the rights of the Lessee thereunder.

9. Counterparts. This Memorandum may be executed in counterparts, each of which shall be deemed an original but all of which together shall constitute one and the same instrument.

RETURN TO

MEMORANDUM OF AGREEMENT

THIS MEMORANDUM OF AGREEMENT (this "Memorandum") is made and entered into as of February 28, 2018 (the "Effective Date"), by and between Michael Johnson and JoAnn Johnson, husband and wife (collectively, "Lessor") and LINCOLN LAND WIND, LLC, a Delaware limited liability company ("Lessee").

1. Property. Lessor and Lessee have entered into a Lease and Easement Agreement for Wind Energy Project (the "Agreement") dated as of the Effective Date, for certain real property located in Morgan County, Illinois, as more particularly described on Exhibit A attached hereto (the "Property"), which Agreement grants to Lessee certain Leasehold and easement rights.

2. Term. The Agreement is for an initial development period of up to seven (7) years, and if the terms and conditions of the Agreement are met, the Agreement shall continue for a construction term and an operation term of up to thirty-five (35) years.

3. Grant of Rights. The Agreement grants Lessee an exclusive leasehold interest in the Property, and grants to Lessee the Operation Easements, all as more specifically set forth in the Agreement. Lessor has leased the Property to Lessee on the terms and provisions set forth in the Agreement. The Agreement is for the use of the Property solely for wind energy purposes, and provides Lessee with the exclusive right to use the Property for wind energy purposes

4. Legal Description. Lessor and Lessee have agreed that under certain circumstances at any time after a legal description of the Property is prepared by a surveyor certified under the laws of Illinois has been completed, Lessee may, at its sole option, unilaterally execute and record an amendment to Exhibit A to set forth the final legal description of the Property. No consent or authorization from Lessor shall be required for such amendment to be effective.

5. Incorporation of Agreement. This Memorandum is for informational purposes only and nothing contained herein shall be deemed to in any way modify or otherwise affect any of the terms and conditions of the Agreement, the terms of which are incorporated herein by reference. This instrument is merely a memorandum of the Agreement and is subject to all of the terms, provisions and conditions of the

Agreement. In the event of any inconsistency between the terms of the Agreement and this instrument, the terms of the Agreement shall prevail.

6. Non-Interference and Setbacks. To the extent permitted by law Lessor has waived any and all setbacks and setback requirements, whether imposed by applicable law or by any person or entity, including without limitation any setback requirements described in any Morgan County Ordinances, or in any governmental entitlement or permit heretofore or hereafter issued to Lessee. Lessor has agreed not to engage in any activity that might cause a decrease in the output or efficiency of the Improvements.

7. Binding Effect. The rights and obligations set forth herein shall be binding upon and inure to the benefit of the parties hereto and their respective heirs, personal representatives, successors and assigns.

8. Recording. This Memorandum is executed for the purpose of recordation in the Official Records of Morgan County, Illinois, in order to establish record notice of the existence of the Agreement and the rights of the Lessee thereunder.

9. Counterparts. This Memorandum may be executed in counterparts, each of which shall be deemed an original but all of which together shall constitute one and the same instrument.

AMENDMENT TO
LEASE AND EASEMENT AGREEMENT FOR WIND ENERGY PROJECT AND MEMORANDUM OF AGREEMENT

This Amendment to the Lease and Easement Agreement for Wind Energy Project and Memorandum of Agreement (this "Amendment") is made, dated and effective as of September 28, 2018 (the "Amendment Effective Date"), between Michael R. Johnson, a/k/a Michael Johnson, and JoAnn Johnson, husband and wife (collectively, "Lessor"), and LINCOLN LAND WIND, LLC, a Delaware limited liability company ("Lessee")

WHEREAS, Lessor and Lessee are parties to that certain Lease and Easement Agreement for Wind Energy Project with an Effective Date of February 2, 2018 (as the same may be modified, amended, and/or supplemented from time to time, the "Agreement"), a memorandum of which (the "Memorandum") was recorded May 3, 2018 as Instrument No. 621819 in the Real Property Records of Morgan County, Illinois ("Official Records");

WHEREAS, Pursuant to the Agreement, Lessor granted and conveyed to Lessee the exclusive right to use that certain property located in Morgan County, Illinois, as more particularly described in Exhibit A attached to the Agreement and attached hereto (the "Original Property") for Wind Energy Purposes including wind resource evaluation, wind energy development, converting wind energy into electrical energy, collecting and transmitting the electrical energy converted from wind energy, and all activities related to the foregoing to the extent set forth in the Agreement; and

WHEREAS, Lessor and Lessee desire to amend the Agreement and Memorandum to add additional real property to the Agreement and Memorandum.

NOW, THEREFORE, for good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, the parties hereby agree as follows:

1. Capitalized Terms. Capitalized terms used herein and not otherwise defined herein shall have the meanings ascribed to such terms in the Agreement.

2. Additional Property. Exhibit A of the Agreement and the Memorandum is hereby amended by adding the description of real property in Exhibit A-1 attached hereto (the "Additional Property"). As of the date hereof, all references in the Agreement and Memorandum to the "Property" shall mean the lands described in Exhibit A and Exhibit A-1 attached hereto.

3. Miscellaneous. The Agreement as amended by this Amendment is ratified, approved and confirmed, and all terms and conditions thereof remain in full force and effect. In the event of a discrepancy between this Amendment and the Agreement, the terms of this Amendment shall control. This Amendment may be executed in counterparts, each of which shall be deemed an original, and all of which together shall constitute a single instrument. The Agreement, together with this Amendment, shall constitute and be referred to as the "Agreement." The Parties agree that this Amendment shall be recorded in the Official Records.

[signature pages follow]

IN WITNESS WHEREOF, the parties hereto have executed this Amendment as of the date set forth above.

merely a memorandum of the Agreement and is subject to all of the terms, provisions and conditions of the Agreement. In the event of any inconsistency between the terms of the Agreement and this instrument, the terms of the Agreement shall prevail.

6. Non-Interference and Setbacks. To the extent permitted by law Lessor has waived any and all setbacks and setback requirements, whether imposed by applicable law or by any person or entity, including without limitation any setback requirements described in any Morgan County Ordinances, or in any governmental entitlement or permit heretofore or hereafter issued to Lessee. Lessor has agreed not to engage in any activity that might cause a decrease in the output or efficiency of the Improvements.

7. Binding Effect. The rights and obligations set forth herein shall be binding upon and inure to the benefit of the parties hereto and their respective heirs, personal representatives, successors and assigns.

8. Recording. This Memorandum is executed for the purpose of recordation in the Official Records of Morgan County, Illinois, in order to establish record notice of the existence of the Agreement and the rights of the Lessee thereunder.

9. Counterparts. This Memorandum may be executed in counterparts, each of which shall be deemed an original but all of which together shall constitute one and the same instrument.

[Signatures on following page]

RETURN TO

MEMORANDUM OF AGREEMENT

THIS MEMORANDUM OF AGREEMENT (this "Memorandum") is made and entered into as of March 16, 2018 (the "Effective Date"), by and between Donald R. Johnson, a single person; Individually and as Life Estate Tenant; and Debra Kay Johnson, f/k/a Debra Kay Pierce, a single ~~/ married~~ person, as Remainderman (collectively, "Lessor") and LINCOLN LAND WIND, LLC, a Delaware limited liability company ("Lessee").

1. Property. Lessor and Lessee have entered into a Lease and Easement Agreement for Wind Energy Project (the "Agreement") dated as of the Effective Date, for certain real property located in Morgan County, Illinois, as more particularly described on Exhibit A attached hereto (the "Property"), which Agreement grants to Lessee certain Leasehold and easement rights.

2. Term. The Agreement is for an initial development period of up to seven (7) years, and if the terms and conditions of the Agreement are met, the Agreement shall continue for a construction term and an operation term of up to thirty-five (35) years.

3. Grant of Rights. The Agreement grants Lessee an exclusive leasehold interest in the Property, and grants to Lessee the Operation Easements, all as more specifically set forth in the Agreement. Lessor has leased the Property to Lessee on the terms and provisions set forth in the Agreement. The Agreement is for the use of the Property solely for wind energy purposes, and provides Lessee with the exclusive right to use the Property for wind energy purposes

4. Legal Description. Lessor and Lessee have agreed that under certain circumstances at any time after a legal description of the Property is prepared by a surveyor certified under the laws of Illinois has been completed, Lessee may, at its sole option, unilaterally execute and record an amendment to Exhibit A to set forth the final legal description of the Property. No consent or authorization from Lessor shall be required for such amendment to be effective.

5. Incorporation of Agreement. This Memorandum is for informational purposes only and nothing contained herein shall be deemed to in any way modify or otherwise affect any of the terms and conditions of the Agreement, the terms of which are incorporated herein by reference. This instrument is merely a memorandum of the Agreement and is subject to all of the terms, provisions and conditions of the

RETURNED TO SENDER RETURN TO

MEMORANDUM OF AGREEMENT

THIS MEMORANDUM OF AGREEMENT (this "Memorandum") is made and entered into as of May 31, 2018 (the "Effective Date"), by and between Richard Lee Bergschneider, a/k/a Richard L. Bergschneider, a/k/a Richard Bergschneider, and Lea E. Bergschneider, husband and wife (collectively, "Lessor") and LINCOLN LAND WIND, LLC, a Delaware limited liability company ("Lessee").

1. Property. Lessor and Lessee have entered into a Lease and Easement Agreement for Wind Energy Project (the "Agreement") dated as of the Effective Date, for certain real property located in Morgan County, Illinois, as more particularly described on Exhibit A attached hereto (the "Property"), which Agreement grants to Lessee certain Leasehold and easement rights.

2. Term. The Agreement is for an initial development period of up to seven (7) years, and if the terms and conditions of the Agreement are met, the Agreement shall continue for a construction term and an operation term of up to thirty-five (35) years.

3. Grant of Rights. The Agreement grants Lessee an exclusive leasehold interest in the Property, and grants to Lessee the Operation Easements, all as more specifically set forth in the Agreement. Lessor has leased the Property to Lessee on the terms and provisions set forth in the Agreement. The Agreement is for the use of the Property solely for wind energy purposes, and provides Lessee with the exclusive right to use the Property for wind energy purposes

4. Legal Description. Lessor and Lessee have agreed that under certain circumstances at any time after a legal description of the Property is prepared by a surveyor certified under the laws of Illinois has been completed, Lessee may, at its sole option, unilaterally execute and record an amendment to Exhibit A to set forth the final legal description of the Property. No consent or authorization from Lessor shall be required for such amendment to be effective.

5. Incorporation of Agreement. This Memorandum is for informational purposes only and nothing contained herein shall be deemed to in any way modify or otherwise affect any of the terms and conditions of the Agreement, the terms of which are incorporated herein by reference. This instrument is merely a memorandum of the Agreement and is subject to all of the terms, provisions and conditions of the

Agreement. In the event of any inconsistency between the terms of the Agreement and this instrument, the terms of the Agreement shall prevail.

6. Non-Interference and Setbacks. To the extent permitted by law Lessor has waived any and all setbacks and setback requirements, whether imposed by applicable law or by any person or entity, including without limitation any setback requirements described in any Morgan County Ordinances, or in any governmental entitlement or permit heretofore or hereafter issued to Lessee. Lessor has agreed not to engage in any activity that might cause a decrease in the output or efficiency of the Improvements.

7. Binding Effect. The rights and obligations set forth herein shall be binding upon and inure to the benefit of the parties hereto and their respective heirs, personal representatives, successors and assigns.

8. Recording. This Memorandum is executed for the purpose of recordation in the Official Records of Morgan County, Illinois, in order to establish record notice of the existence of the Agreement and the rights of the Lessee thereunder.

9. Counterparts. This Memorandum may be executed in counterparts, each of which shall be deemed an original but all of which together shall constitute one and the same instrument.

[Signatures on following page]

IN WITNESS WHEREOF, the parties hereto have executed this Memorandum as of the date first set forth above.

Exhibit A to Memorandum of Agreement

Legal Description of the Property

Situate in the County of Morgan, and State of Illinois, to-wit:

Tract 1

The Northwest quarter (NW¼) of the Northwest quarter (NW¼) of Section Ten (10) EXCEPT the West 896 feet; and FURTHER EXCEPTING that part lying North of the road;
The North half (N½) of the Southwest quarter (SW¼) of the Northwest quarter (NW¼) of Section Ten (10) EXCEPT the West 896 feet;
The West Twenty (20) acres of the East half (E½) of the Northwest quarter (NW¼) of Section Ten (10);
All in Township Fourteen (14) North, Range Nine (9) West of the Third Principal Meridian, Morgan County, Illinois.

Tracts 2-5

54 acres off of the East side of the West half of the Southwest Quarter of Section 10.

The West 896 feet of the North half of the Northwest Quarter of Section 10 and the West 896 feet of the North half of the Southwest Quarter of the Northwest Quarter of Section 10;

The West 1,912 feet of the Northwest Quarter of Section 15 except the South 15.18 feet of that part of the above described property that is located in the East Half of the Northwest Quarter of Section 15;

All that part of the West 1,912 feet of South half of the Southwest Quarter of Section 10 lying South of an existing Public Road;

All the above described property being located in Township 14 North, Range 9 West of the Third Principal Meridian, Morgan County, Illinois;

Tract 6

Nineteen and three-fourths (19 3/4) acres off of the South end of the West half of the Northeast Quarter of Section 10 bounded as follows:

Beginning at the Southwest corner of said lot, running thence East 79 rods, thence North 40 rods, thence West 79 rods, thence South 40 rods to the place of beginning, all in Township 14 North and Range 9 West of the Third Principal Meridian, Morgan County, Illinois;

All of the above subject to public utility easements of record and as now located, and to that part of the premises taken, used or dedicated for roads and highways, right-of-way for drainage ditches, drain tiles, feeders, laterals and underground pipes, if any;

Tracts 7-8

70 acres off of the South end of the West Half of the Southeast Quarter of Section 9, and
30 acres off of the South end of the Northeast Quarter of the Southwest Quarter of Section 9,
all in Township 14 North and Range 9 West of the Third Principal Meridian, subject to public highways as now located,

Tracts 9-11

The Northeast Quarter of the Northwest Quarter of Section Ten (10) except the West 10 acres and also except the South 132 feet of the East 330 feet, in Township Fourteen (14) North, Range Nine (9) West of the Third Principal Meridian, Morgan County, Illinois.

AND

The Northwest Quarter of Section Fifteen (15) except the West 1,912 feet and also except the South 15.18 feet;
